Feature guide & interview walkthrough

Released dashboard with actual feature screenshots

A decision workflow for GoTo corporate development
Move from a signal to its business implications, investment route, alternatives and next evidence check.

Open the live dashboard

Reconciled coverage in this snapshot
235 ecosystem profiles; 106 position entries; 62 consolidated legal entities; 63 unique peers and benchmarks; 8,736 2026 signal records; 219 research entries (32 reviewed summaries); 34 indicators; eight policy records; 1,370,230 dated written-review observations. Counts measure collected records, not fully verified events or complete public-store history.

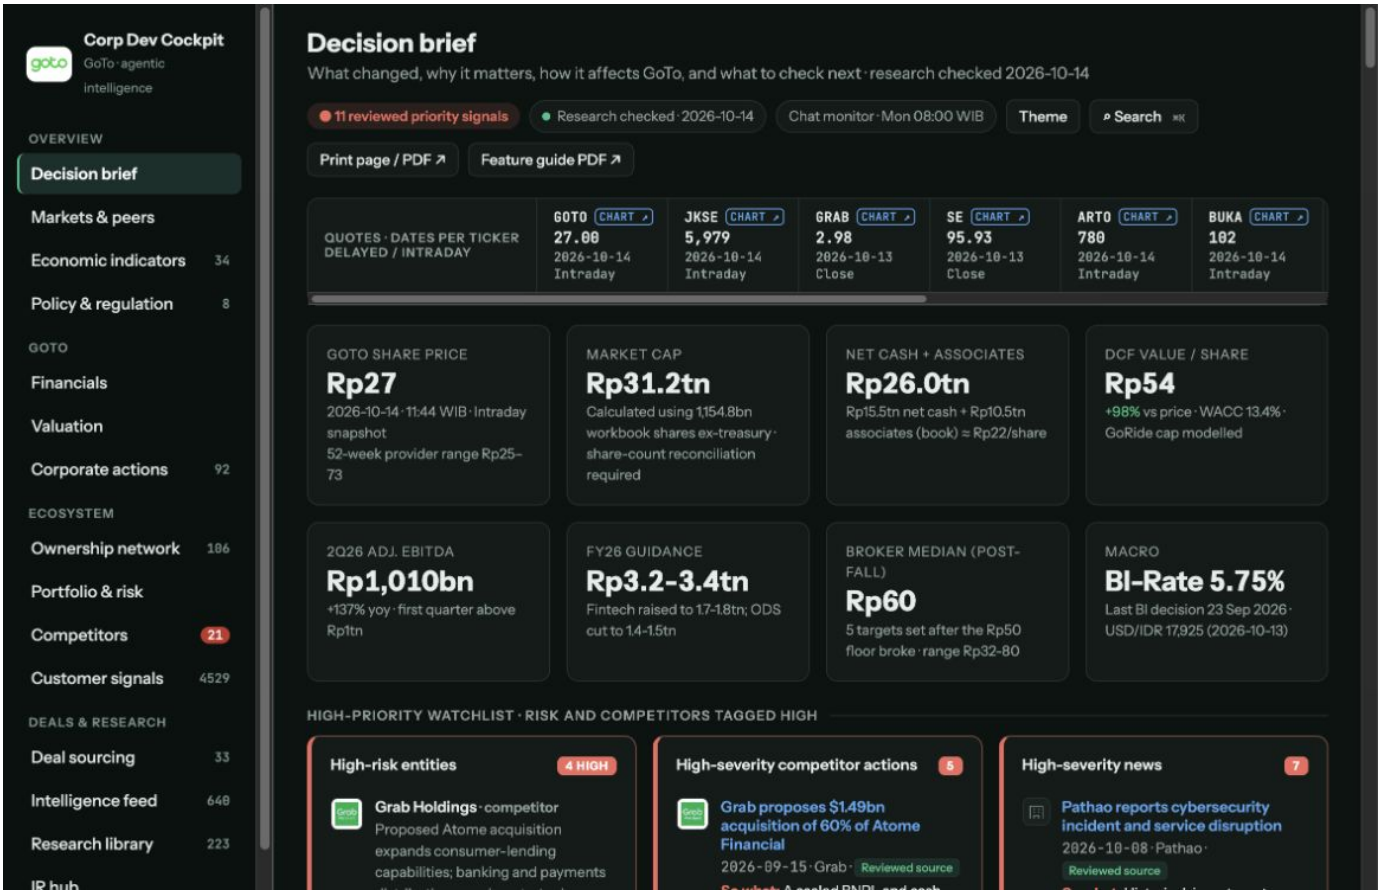

Five-minute demonstration
1. Decision brief: identify a material signal.
2. Ownership network: identify the affected company and its actual investment route.
3. Portfolio: distinguish direct equity, Bintang Kecil and Argor funds.
4. Competitors and sourcing: compare strategic responses.
5. Valuation: identify the assumption to test, then open the detailed sheet.

Print any page or tab as PDF
Open the desired page, apply its filters and click **Print page / PDF**. In a company workspace, click **Print tab / PDF** to print the selected company section. Choose **Save as PDF** in the browser print dialog. The print layout keeps the current content and chart images while removing navigation. External interactive frames become source links.

Reading the evidence
Reviewed issuer facts, third-party profiles, attributed reference research, analyst scenarios and unreviewed RSS leads remain distinguishable. This is a curated snapshot for interview discussion, not an unattended live investment recommendation engine.

Decision brief

Start with material decisions, then follow the evidence.

1. Priority signals and the new direct badge dialog connect what changed to the affected GoTo business, the economic mechanism and the next check.

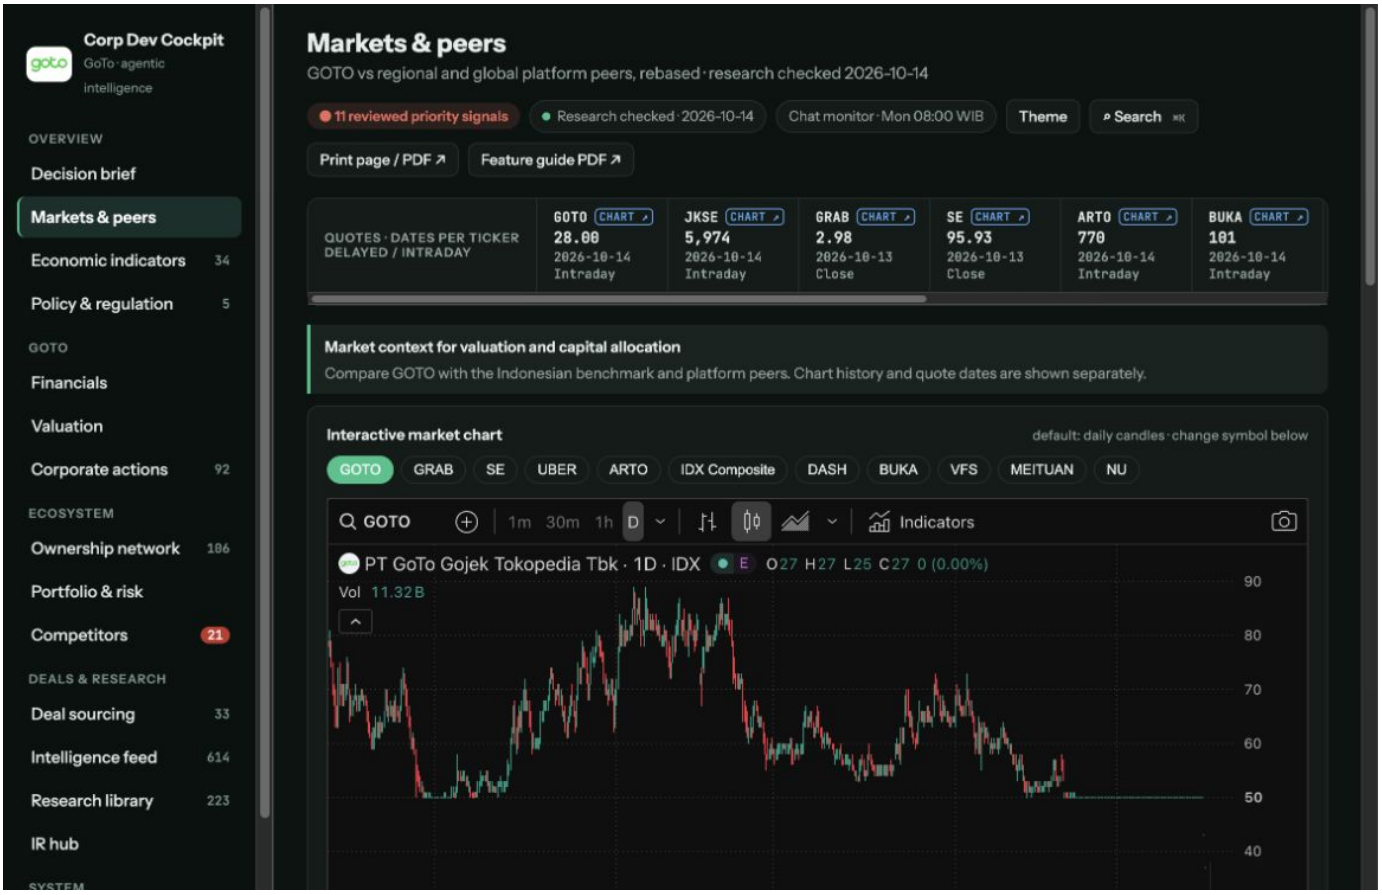

2. Competitor actions, portfolio risks, operating updates and reviewed research appear together. Open the source and expand context before changing a recommendation.

3. The eleven reviewed priority signals are distinct from the larger discovery feed. Severity is an analyst judgment.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

Markets & peers

Connect market sentiment to financing capacity and deal currency.

1. Compare observed historical returns for available listed peers and open full TradingView charts from the price strip.

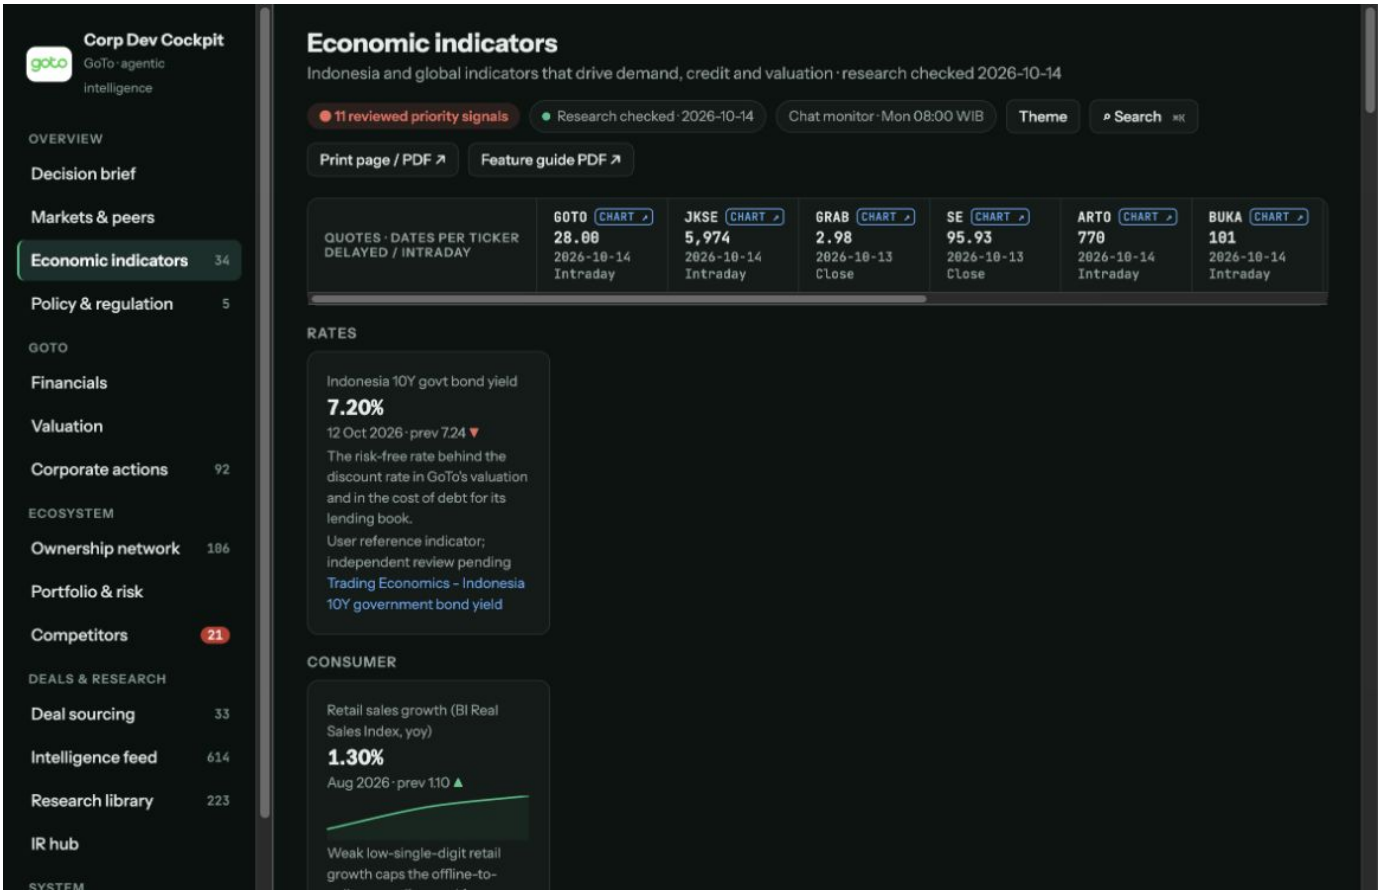

2. Historical comparisons use observed prices without interpolation. GOTO and the IDX Composite are included. The comparison uses the common available daily window ending 13 October; the separately dated intraday quote and live provider chart remain distinct.

3. Quotes retain their observation dates. Provider widgets can update independently of the research snapshot.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

Economic indicators

Translate macro conditions into operating and valuation assumptions.

1. Coverage includes rates, inflation, exchange rates, activity, liquidity and other Indonesia or global indicators.

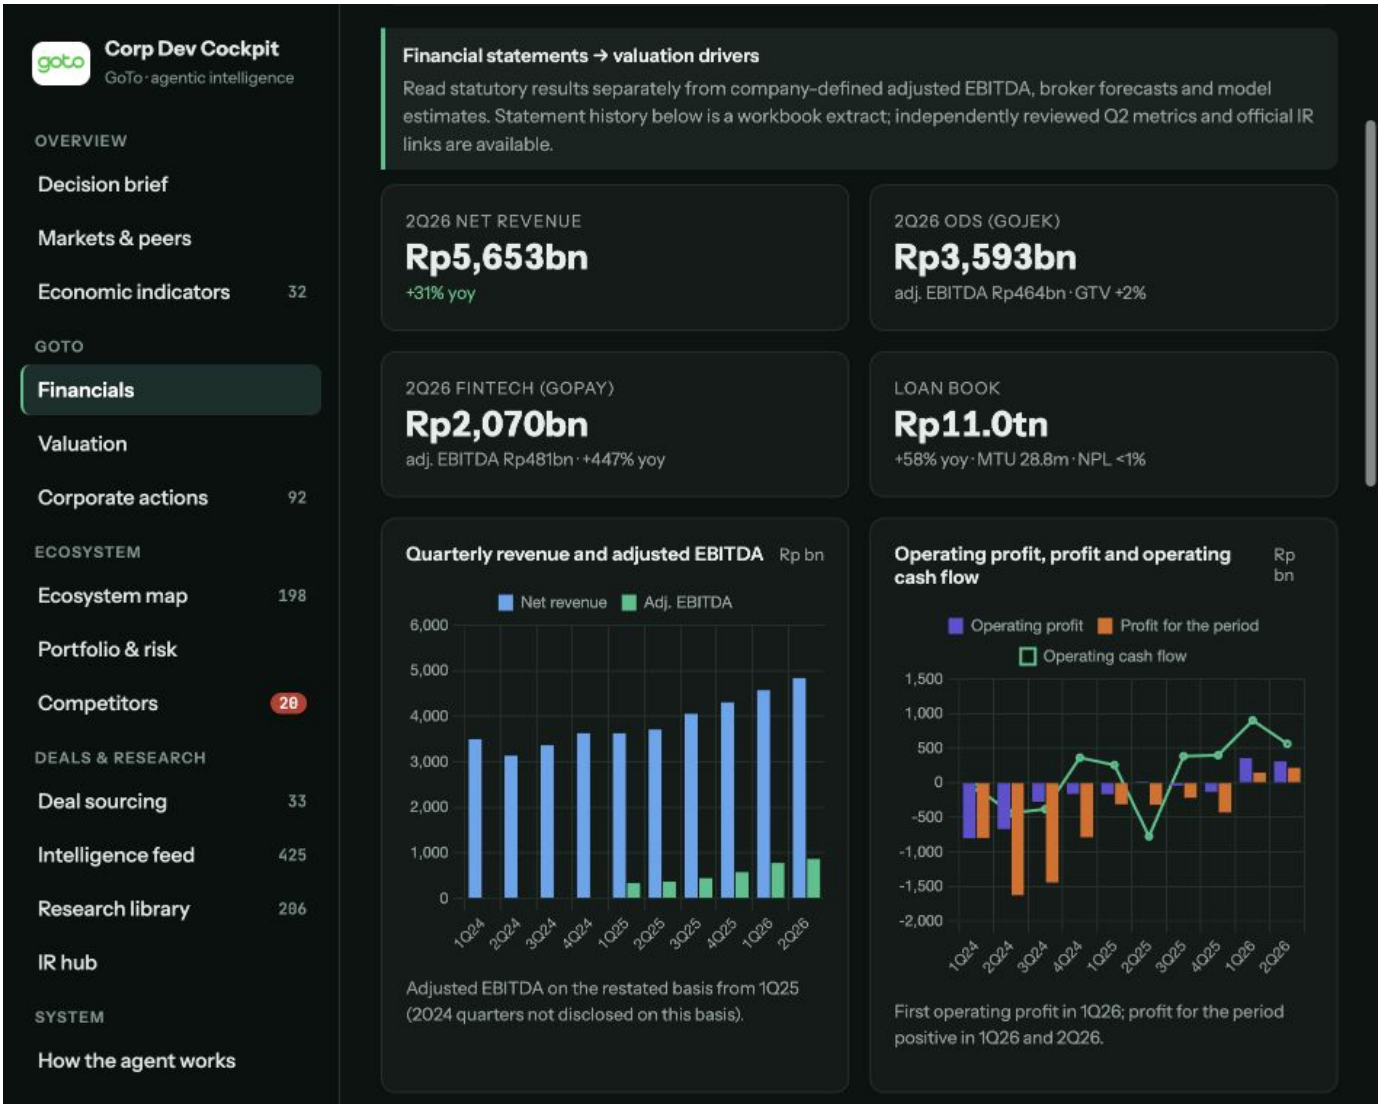

2. Each indicator carries a source and date; forecasts and reference observations remain labelled.

3. Use the transmission to demand, funding costs, credit quality and discount rates to decide what needs a model update.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

Financial performance

Reported results, profitability and model inputs in one view.

1. Quarterly revenue and adjusted EBITDA charts now render alongside operating profit, profit for the period and operating cash flow.

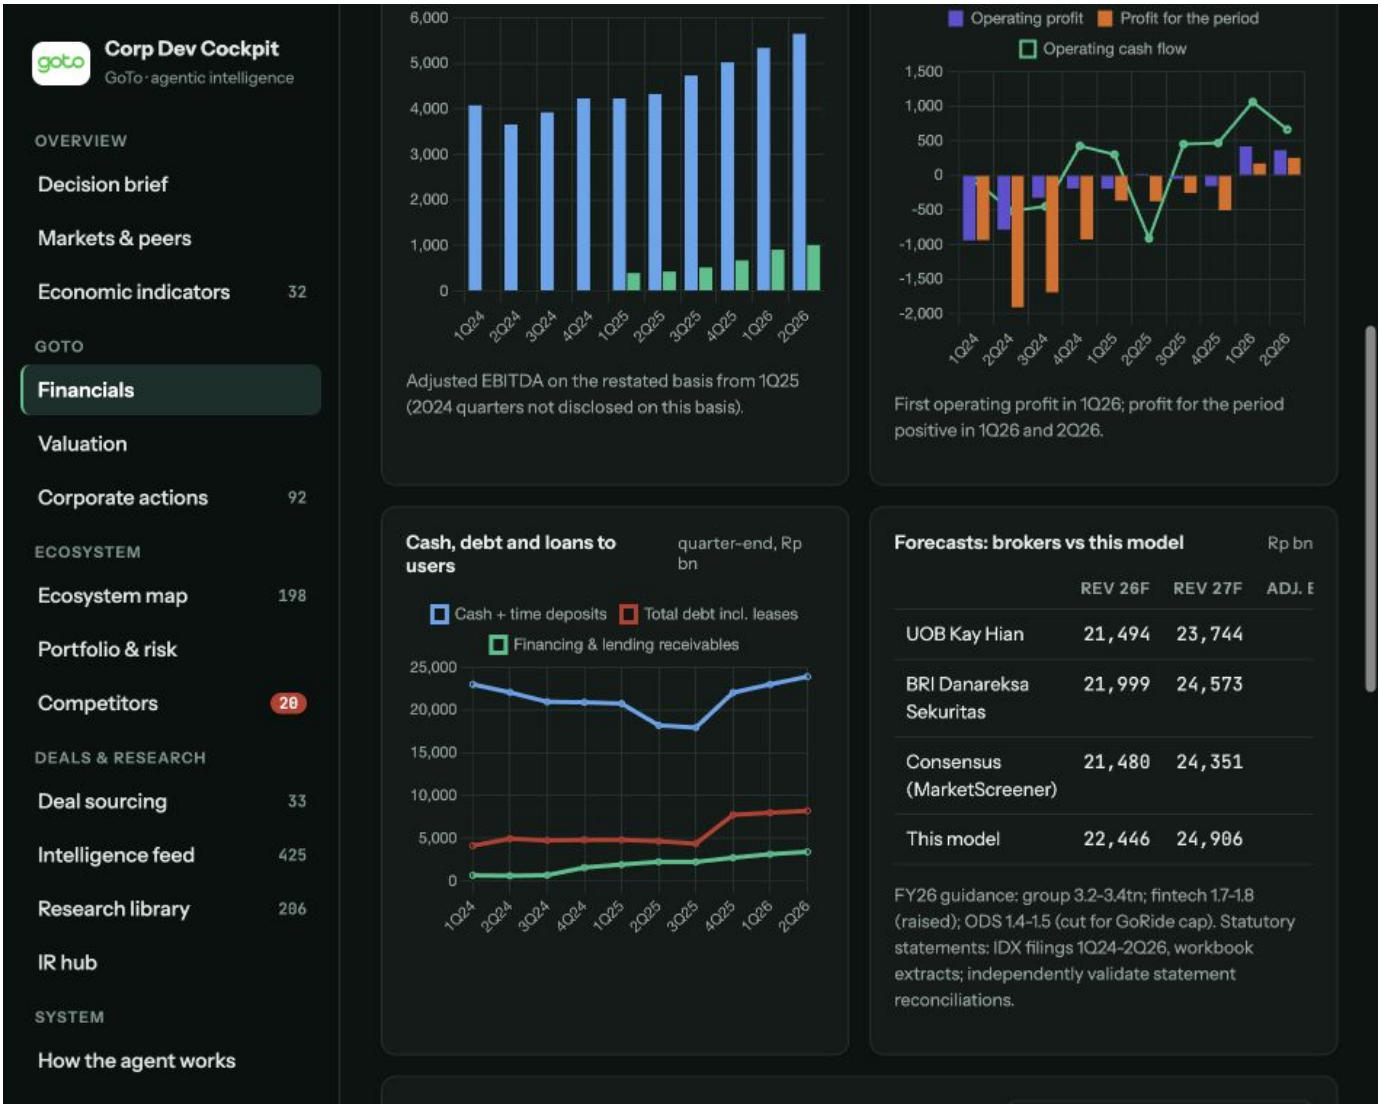

2. Statutory profit, profit attributable to owners and company-defined adjusted EBITDA are different measures. Source definitions remain visible.

3. The financial history is a workbook extract. Reviewed issuer metrics and official IR sources provide independent checks.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

Financial balance sheet

Evaluate liquidity, leverage and credit expansion.

1. The cash, debt and customer-loan chart now displays its complete series. Compare balance-sheet trends with growth and credit economics.

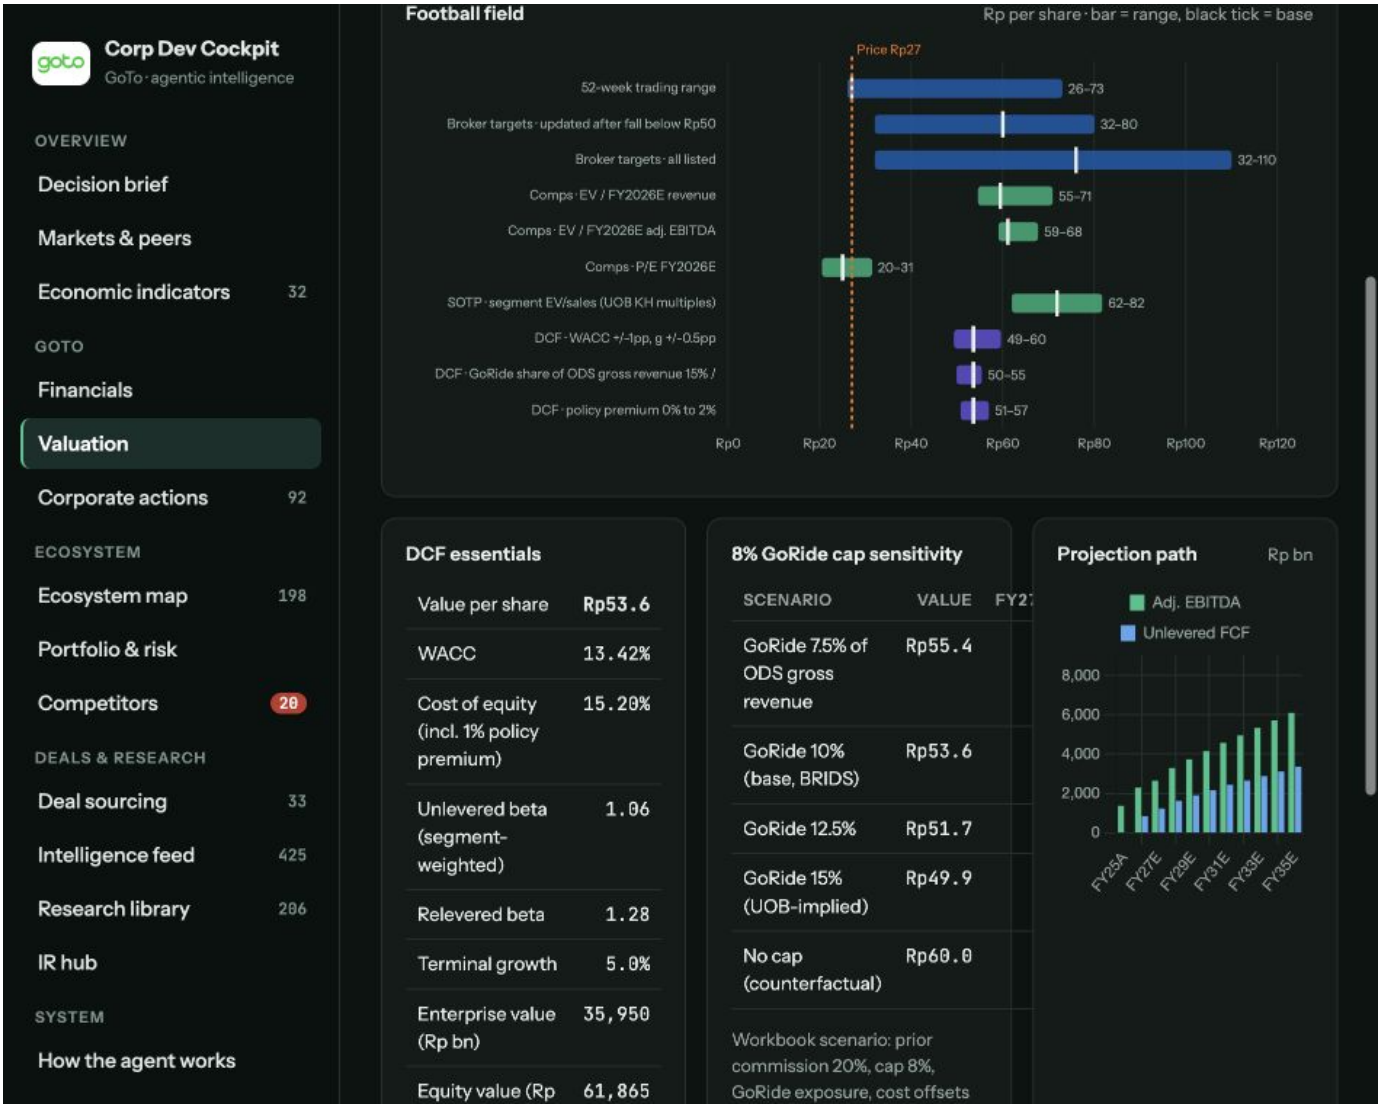

2. Broker forecasts, consensus and the user model are separate columns with different assumptions and vintages.

3. Open the underlying workbook for reconciliation. Consolidated cash and debt do not establish a private investee valuation.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

Valuation summary

Keep the dashboard concise and the detailed model accessible.

1. The football field compares DCF, comparable multiples, SOTP, broker targets and sensitivity ranges.

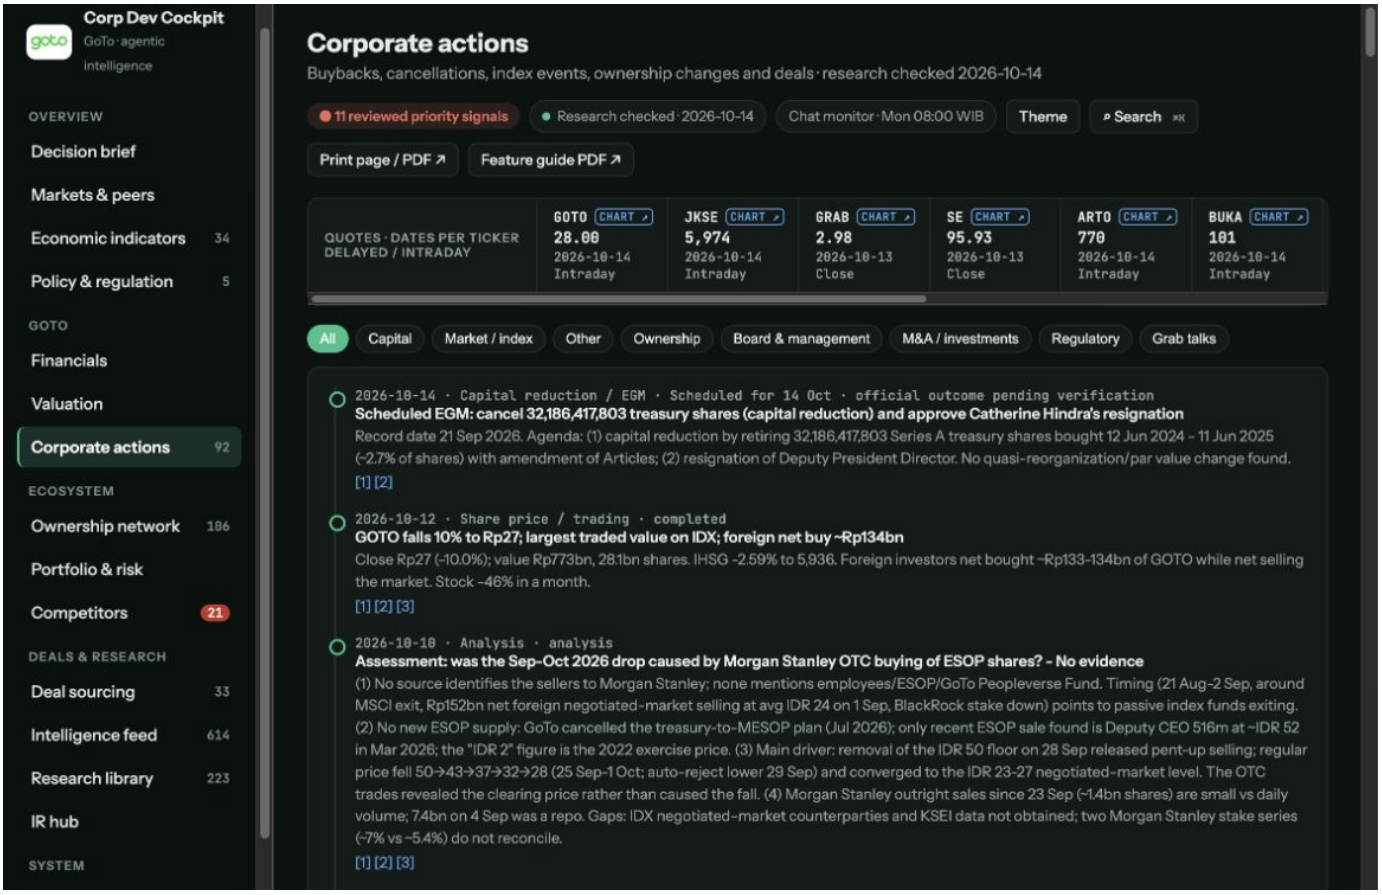

2. The projection chart now shows adjusted EBITDA and unlevered free cash flow. DCF essentials and policy scenarios remain visible.

3. Open detailed DCF, comps and assumptions in the linked Google Sheet in another tab. Outputs are model scenarios, not verified transaction prices.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

GoTo corporate actions

Read each corporate event through its capital and strategic effect.

1. Review the dated action, status, source and strategic implication; distinguish proposals from completed or implemented changes.

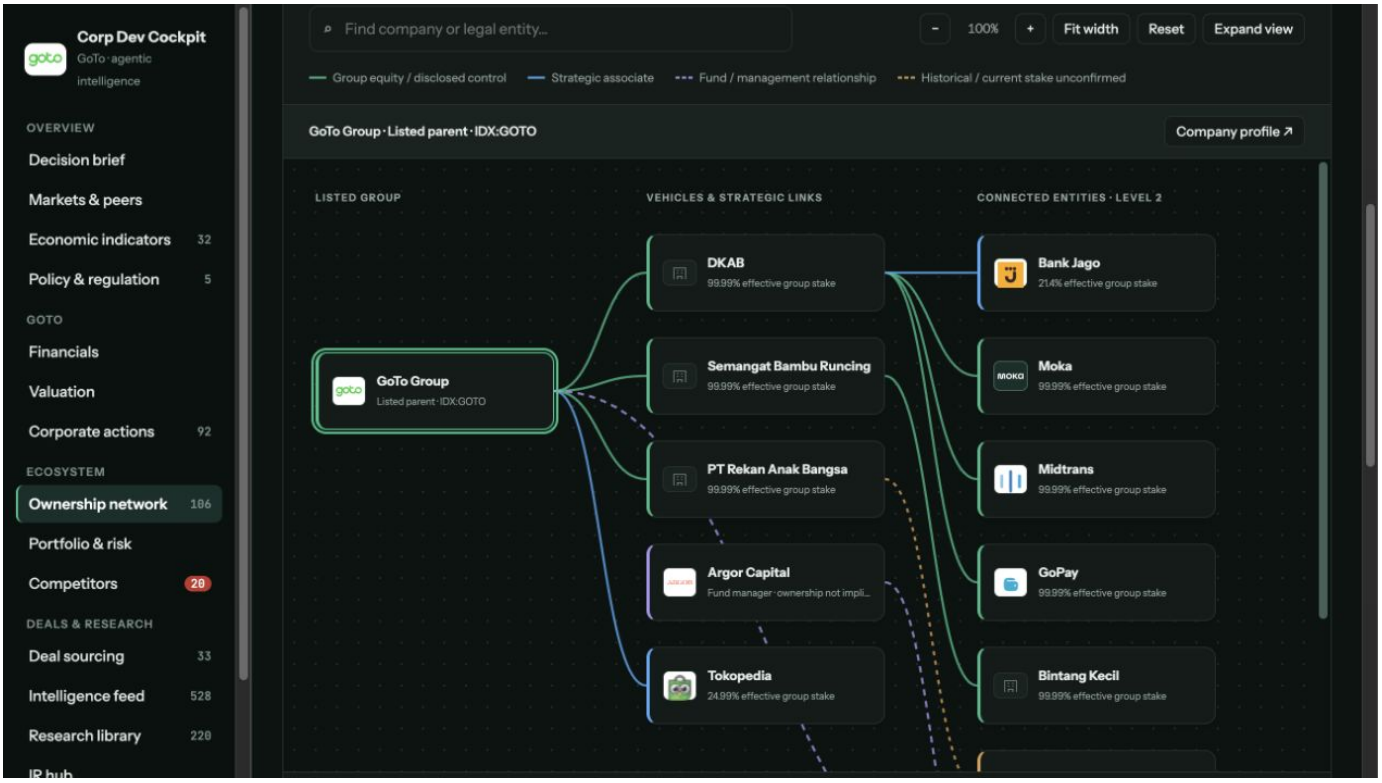

2. Use dilution, buybacks, ownership changes and partnerships as prompts to revisit share counts, funding needs or exposure.

3. The 92 records include attributed reference research; a record count does not mean every action has been independently reverified.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

Ownership network

Follow the documented investment route, then inspect its evidence.

1. The ownership network is now the only ecosystem visualization. Six views separate the overview, group equity, Bintang Kecil, Argor funds, historical positions and the full legal inventory.

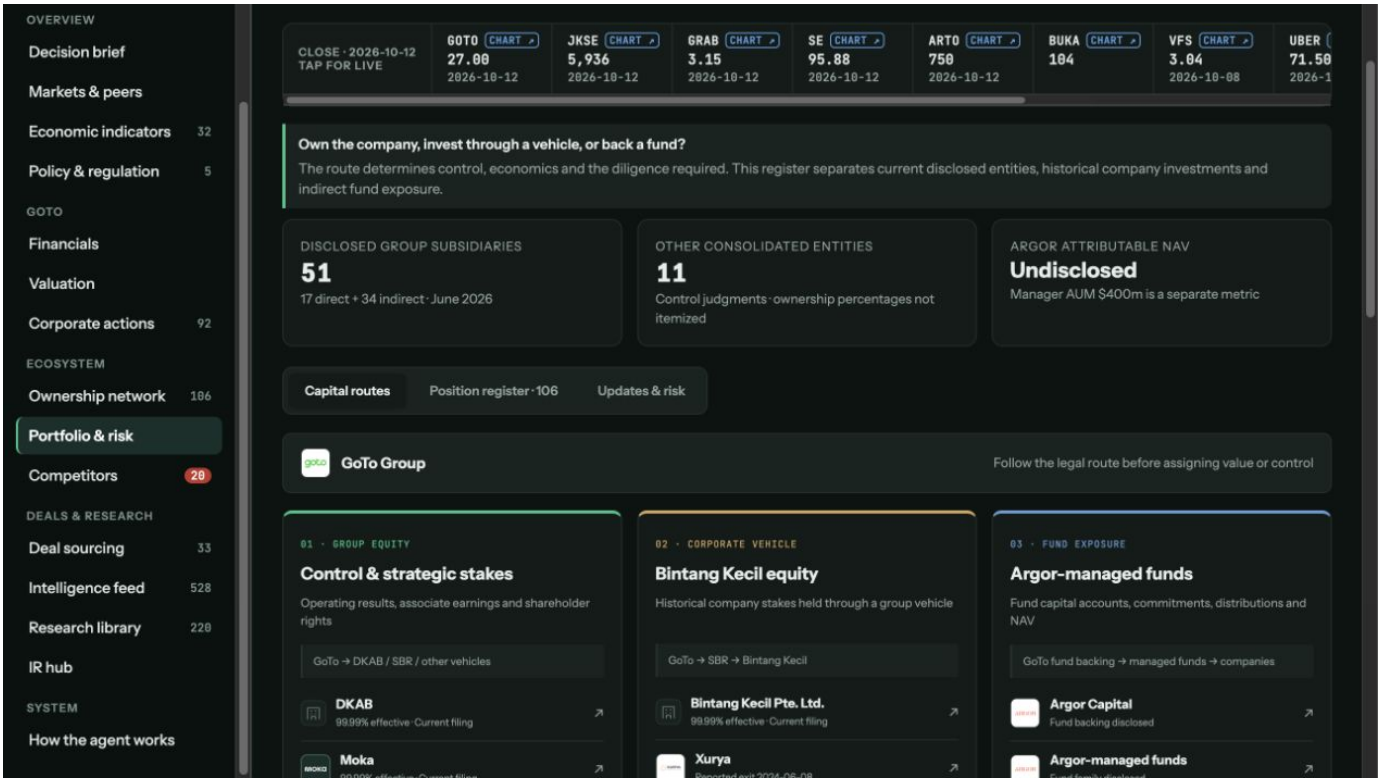

2. Company search retains documented upstream connections. Select a node to highlight its route and access ownership facts, reviewed news, source evidence and the full company workspace.

3. Zoom, fit-width, reset and expand controls help navigate larger branches. Authentic company logos are used where available; legal entities without a verified logo have a neutral symbol.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

Portfolio capital routes

Separate operating subsidiaries, corporate equity and fund exposure.

1. Three branches distinguish direct or effective group equity, the Bintang Kecil corporate vehicle and Argor fund exposure.

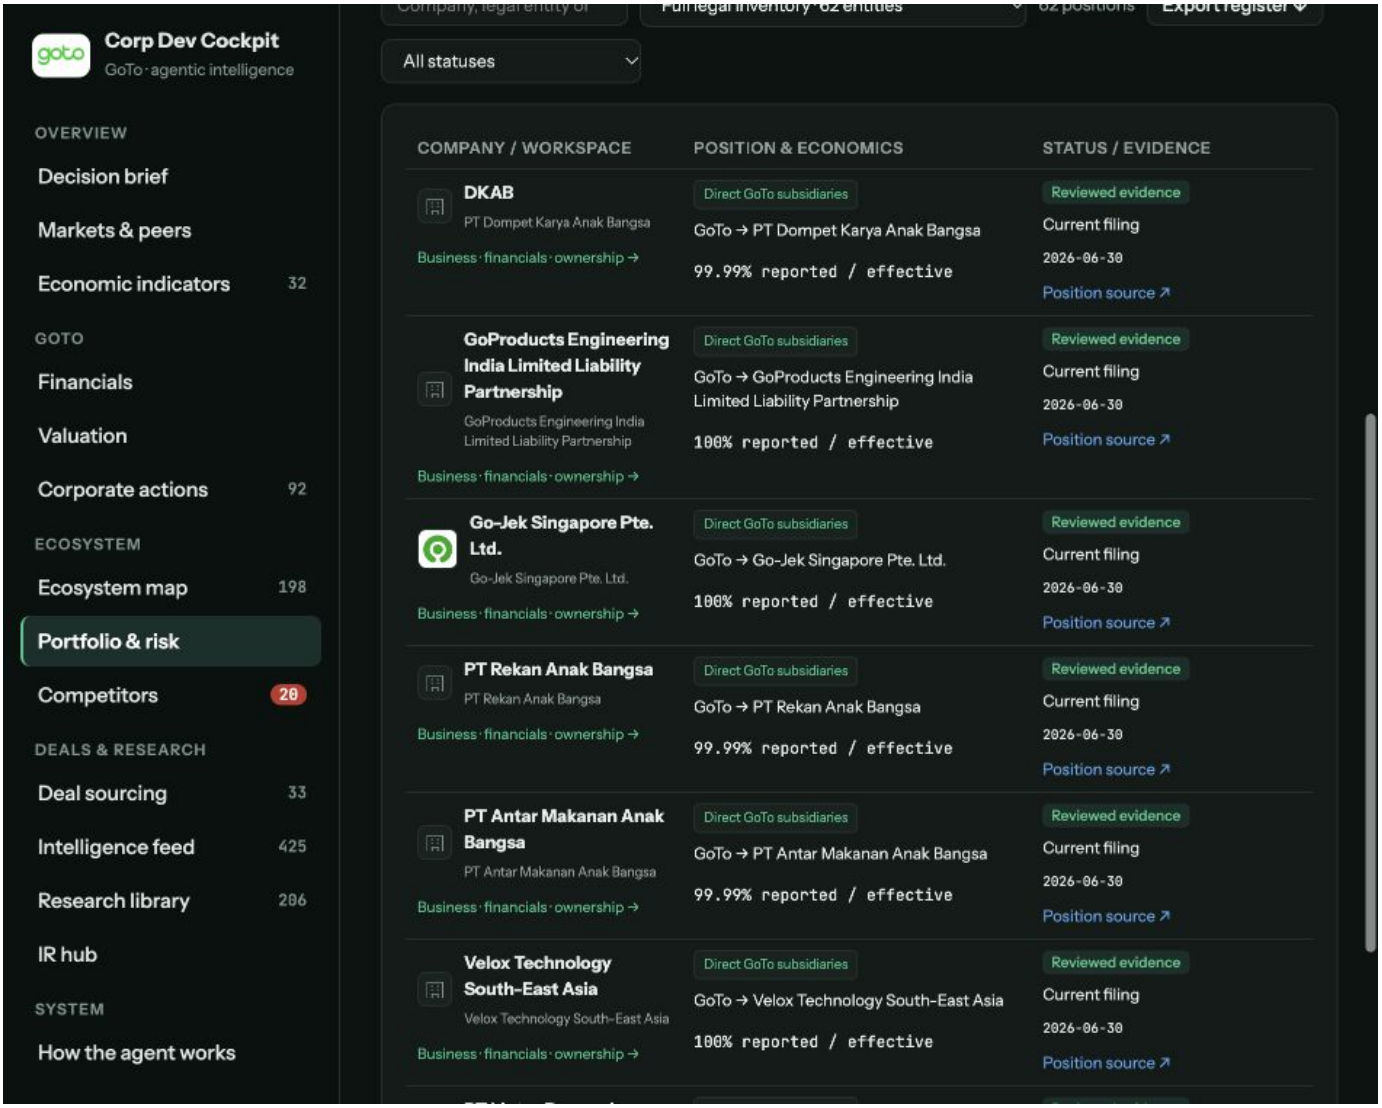

2. Moka sits under the consolidated DKAB route. Argor underlying companies are fund portfolio examples rather than direct GoTo stakes.

3. Bintang historical Xurya and Laku6 investment links retain reported-exit labels. Current residual interests and proceeds need evidence.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

Portfolio position register

Inspect the exact route, economics, status and evidence.

1. The compact register contains 106 disclosed or researched positions, with route, status and company-search filters.

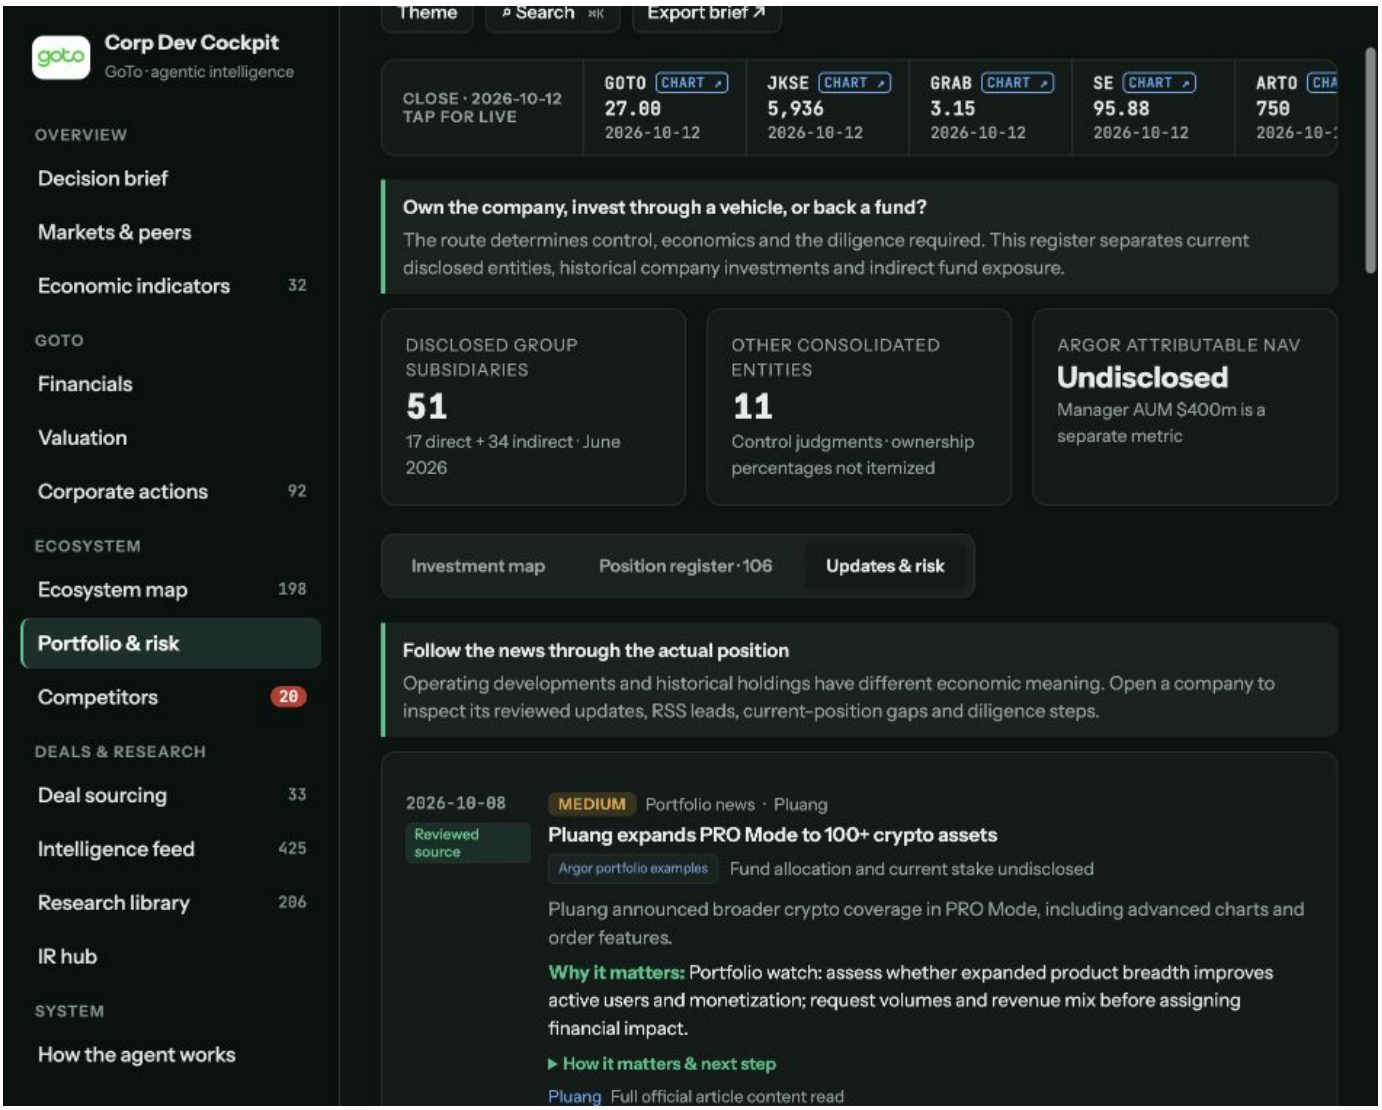

2. The repaired 51 subsidiaries plus 11 other consolidated entities link opens the register with all 62 legal entities selected.

3. Effective group percentages differ from immediate-holder percentages. Carrying amounts, pre-elimination assets and market values are not interchangeable. CSV export is available.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

Portfolio updates & risk

Follow the news through the actual investment position.

1. Operating developments are linked to their company profile and to the investment route where established.

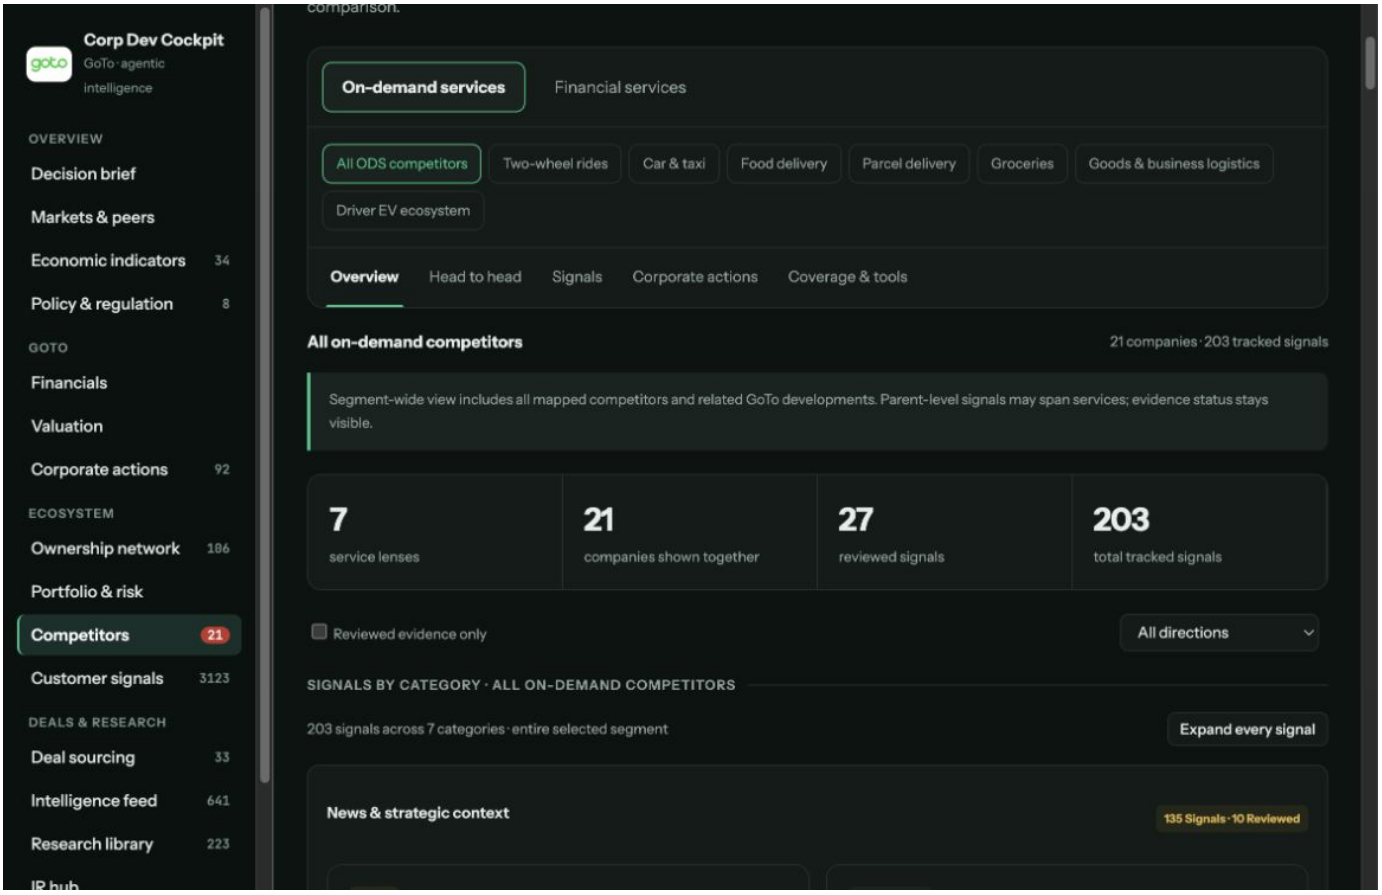

2. Monitoring includes funding, adoption, credit quality, governance, regulatory changes, security incidents and potential exits.

3. Historical investment news does not automatically establish current GoTo exposure. Fund NAV, distributions and commitments require fund-level reporting.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

Competitors

Compare business performance and strategic corporate actions.

1. Within ODS and Financial Services, view the full signal board grouped by financial performance, M&A;, capital markets, business moves, operating risks, policy and strategic context. Expand each category or all signals; all mapped companies and parent / regional benchmarks remain in the board.

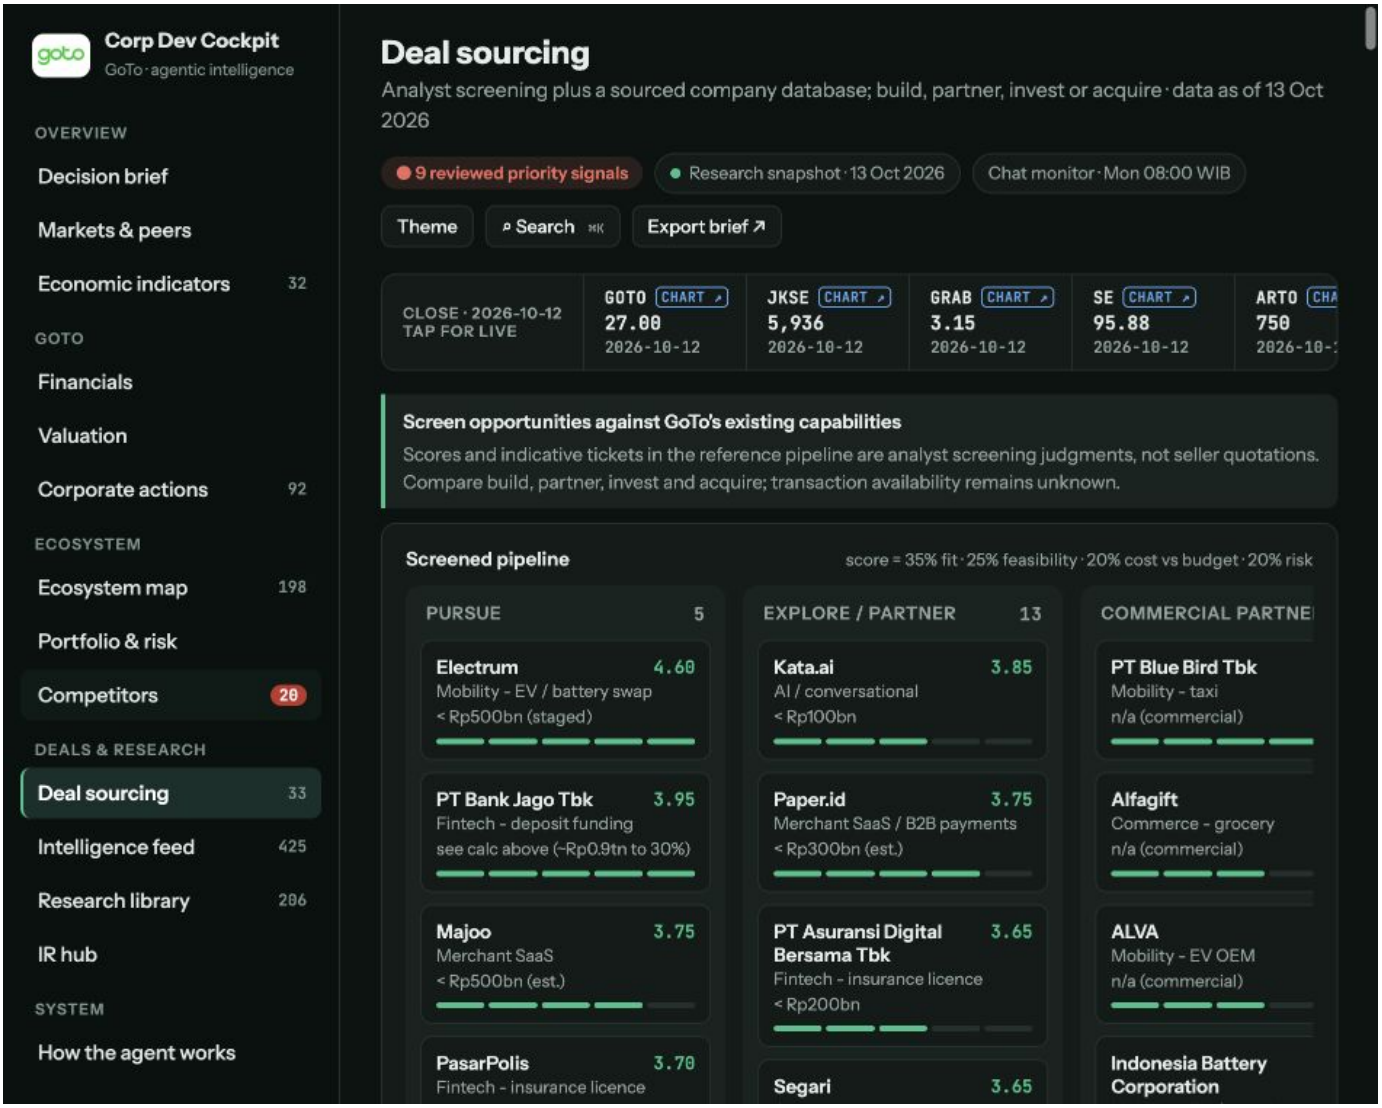

2. Issuer financial releases and corporate actions are distinct from discovered headlines and attributed reference analysis.

3. Use the implication and next milestone to screen pricing pressure, funding capacity, competitive advantage and possible strategic responses.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

Deal sourcing

Screen build, partner, invest and acquire alternatives.

1. The 33 screened opportunities carry a strategic hypothesis, reference scoring and indicative capital requirements.

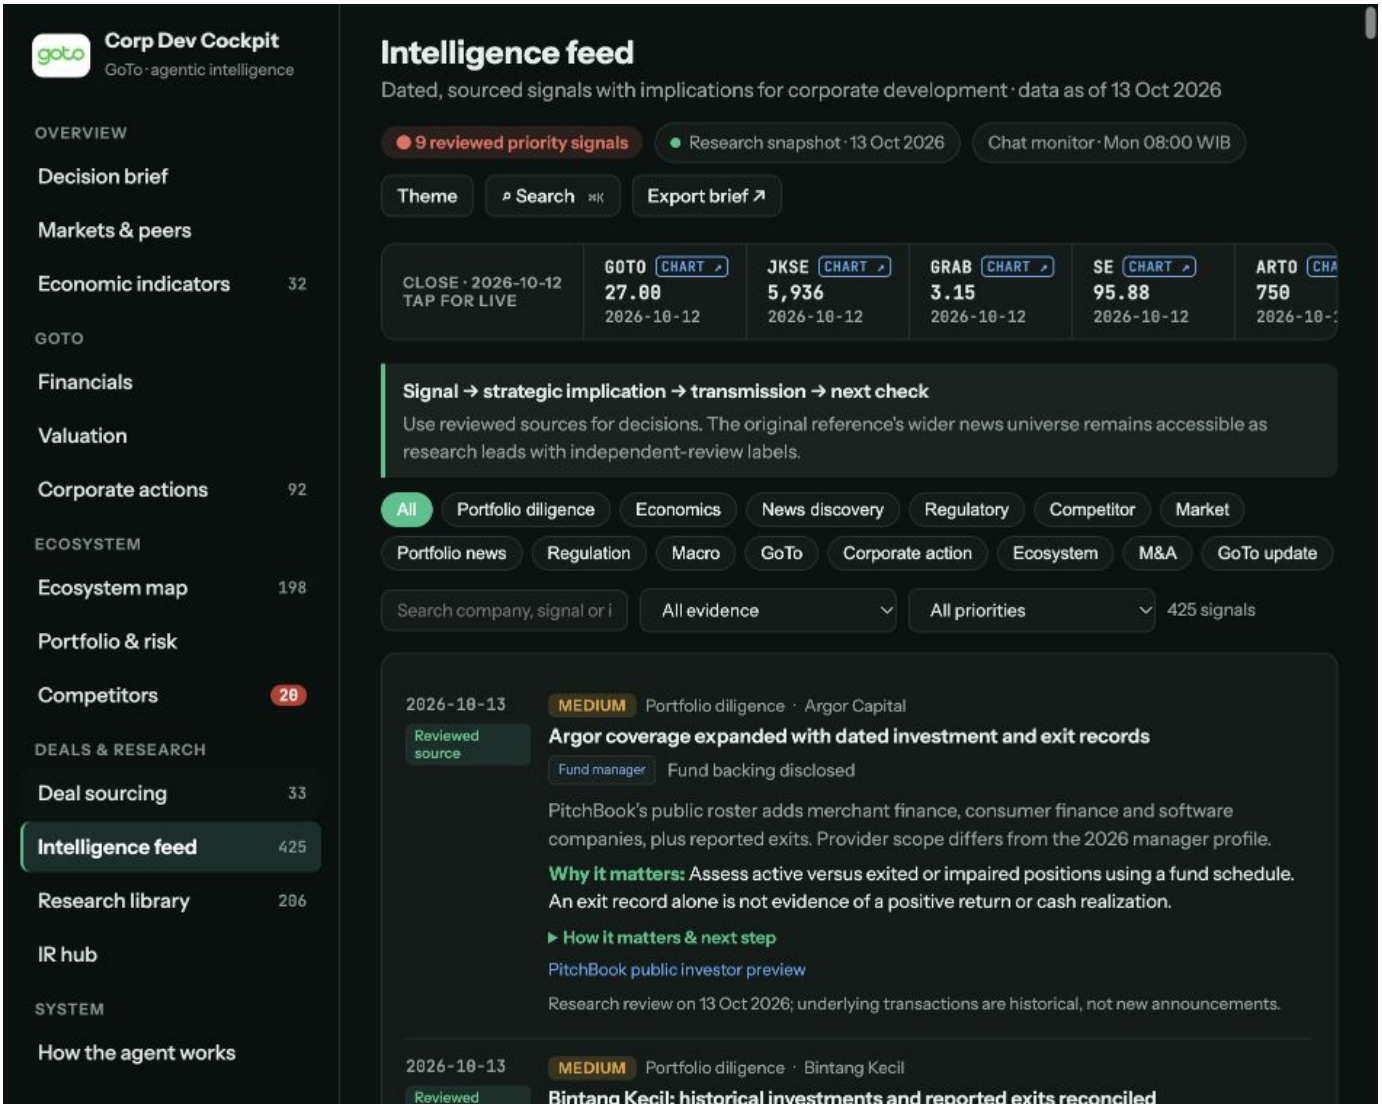

2. Company workspaces organize overview, strategic fit, signals, financial visibility, ownership, diligence and source links.

3. Scores and ticket sizes are analyst scenarios. They do not prove company availability, seller intent, valuation or completed diligence.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

Intelligence feed

Search the broader signal universe without losing evidence quality.

1. The annual feed contains 8,736 records after source overlap reconciliation. Reviewed signals, attributed reference analysis and unreviewed discovery leads remain separate.

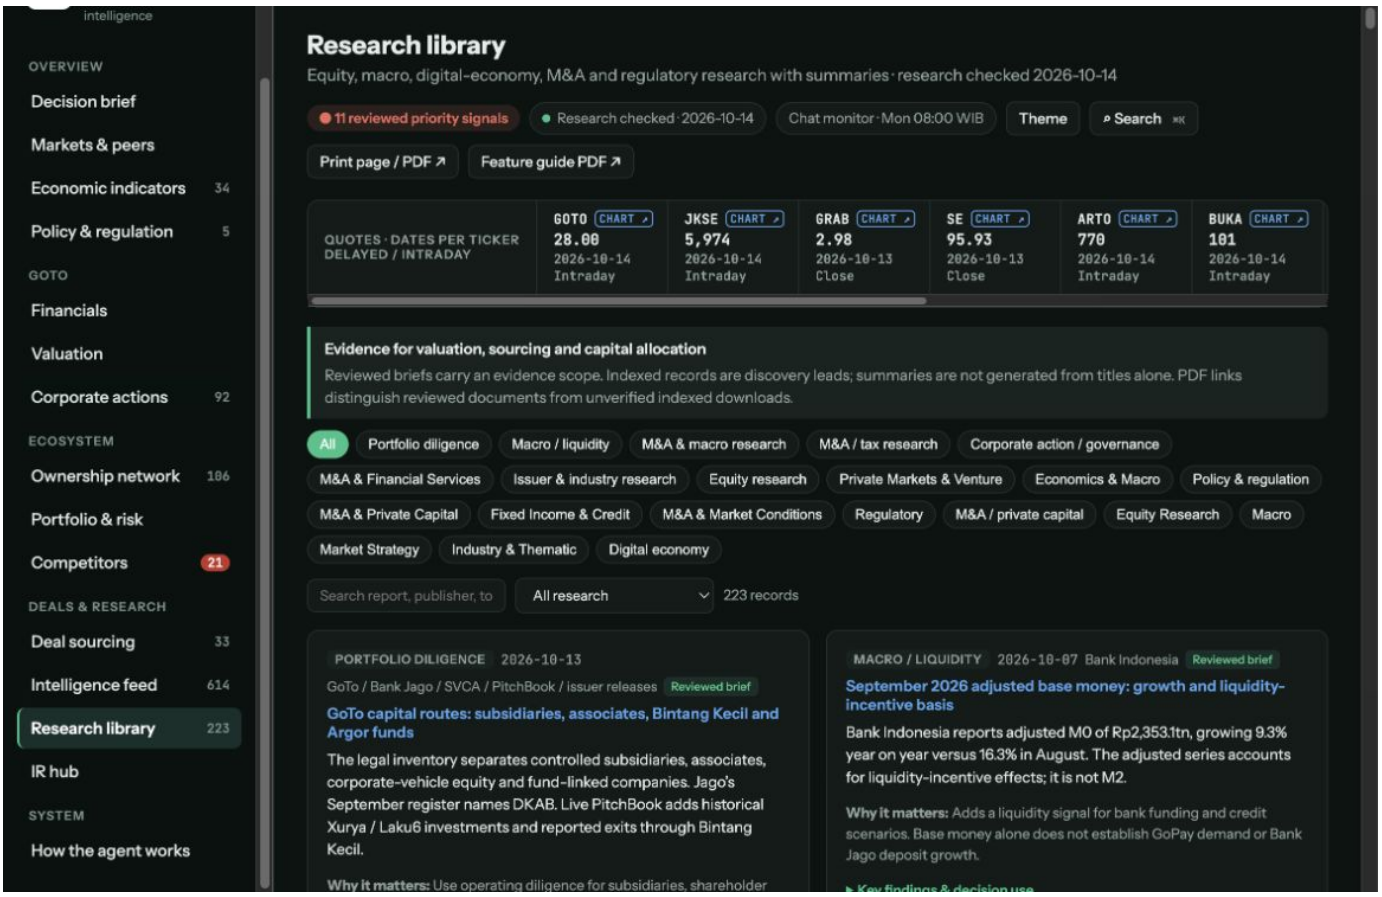

2. Current RSS retrieval covers 177 companies; retained matches are screened for ambiguity and spam. Headline matches need article review.

3. Open sources, verify company identity and promote only material, reviewed developments to a decision brief.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

Research library

Turn reports into decision context and source-linked reading.

1. The library contains 219 distinct entries after duplicate reports and summaries are reconciled, including equity research, M&A; reports, industry analysis and macro material.

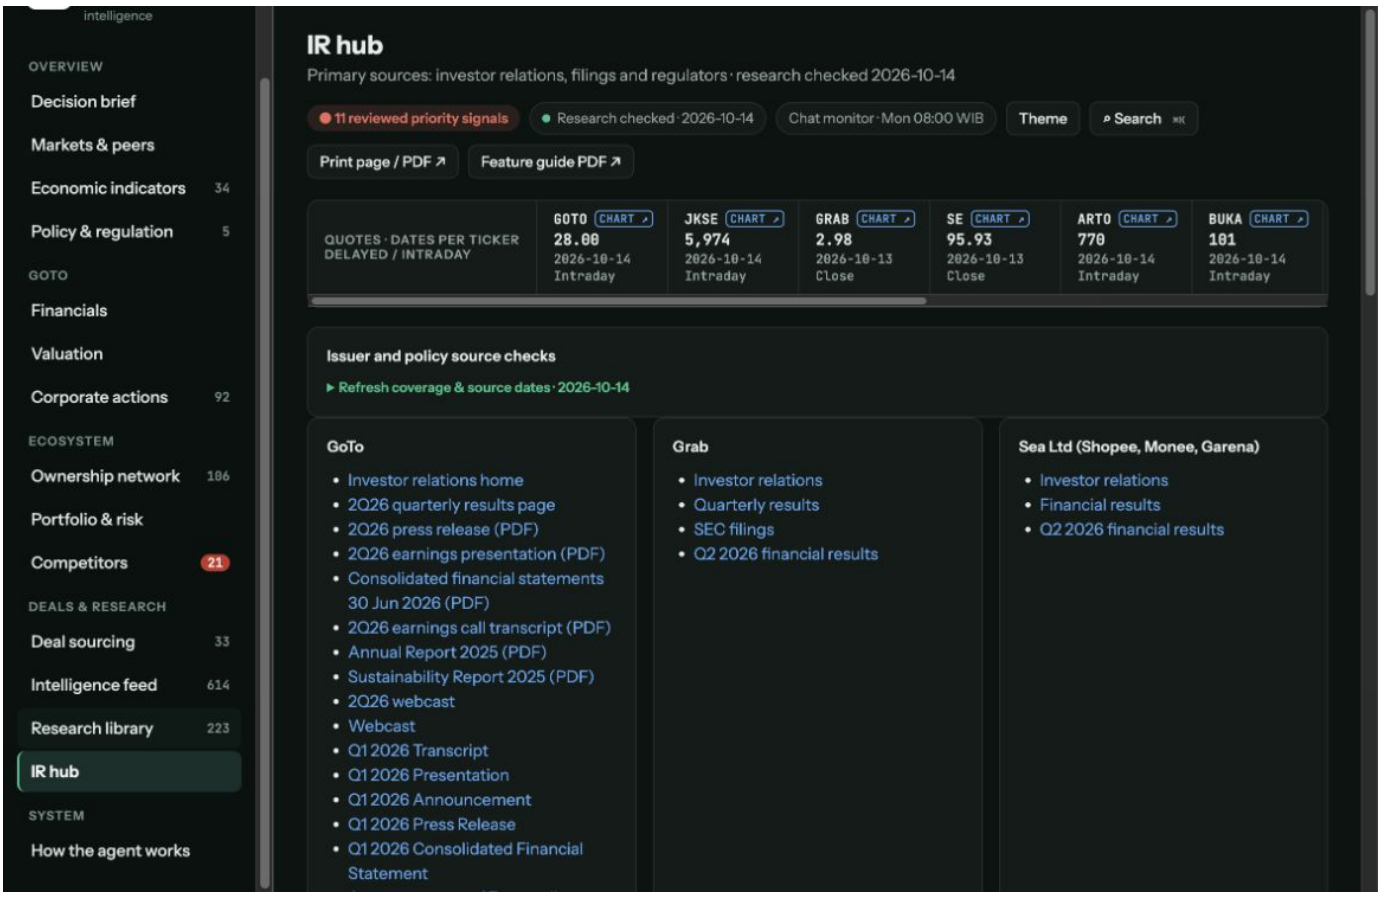

2. Thirty-two reviewed research briefs provide summaries, takeaways, decision relevance and evidence scope. Other indexed documents remain reading leads.

3. Open available PDF or publisher links. Reviewed research is also surfaced in Decision brief to connect findings with operating and investment choices.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

Investor relations hub

Go directly to authoritative issuer disclosures.

1. Issuer websites, results, presentations, shareholder information and financial filings provide the primary evidence layer.

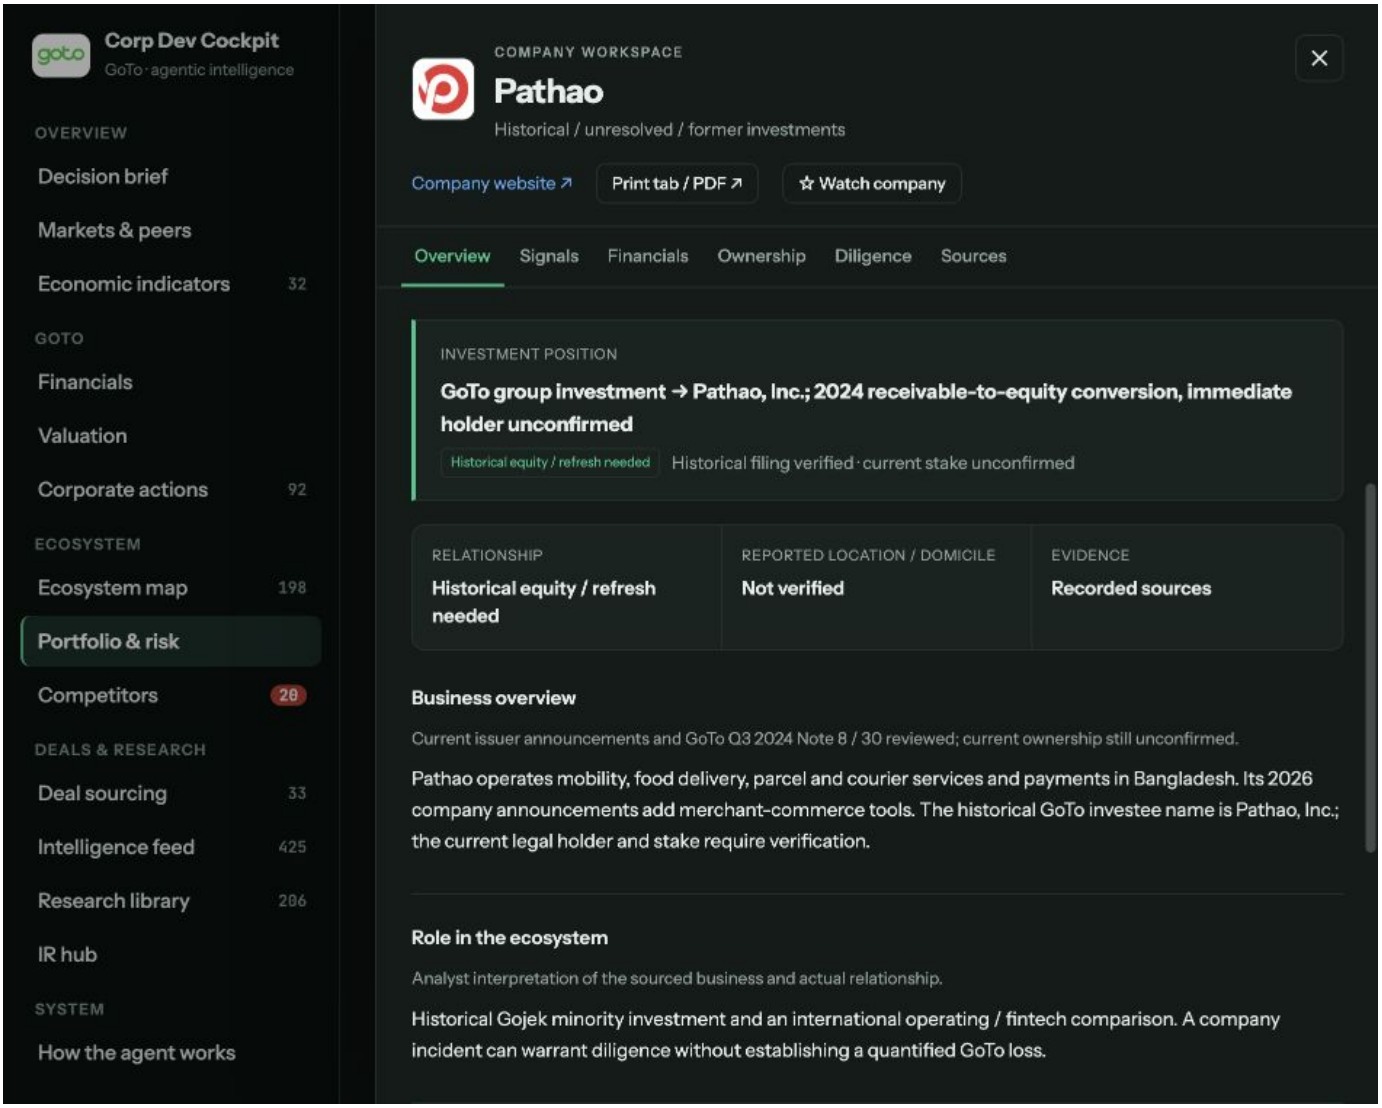

2. GoTo, peers and selected public ecosystem companies have source-linked coverage and chart access where mapped.

3. The hub is a dated collection of links. The separate weekly chat monitor does not silently refresh this public website.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

Company overview

Understand what a company does and why it belongs in the ecosystem.

1. The overview includes business description, relationship route, operating context, monitoring themes and the latest reviewed signal.

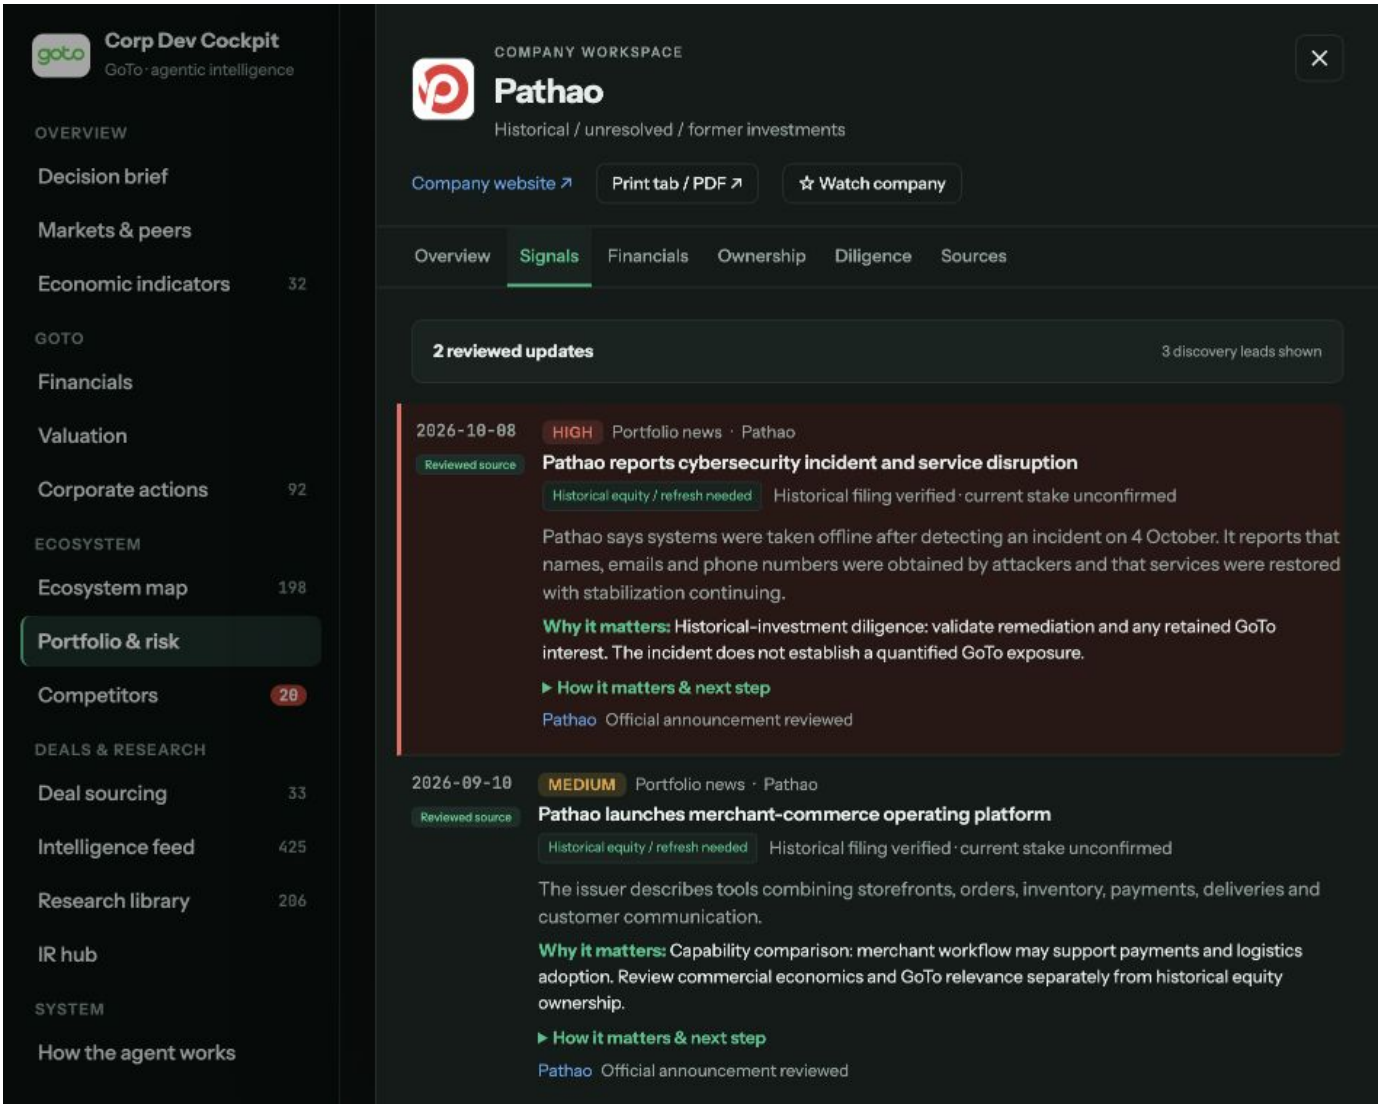

2. Pathao illustrates how historical GoTo investment evidence and recent cybersecurity or business updates are assessed separately.

3. Watch-company state is stored in the browser. It is not a shared portfolio management database.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

Company signals

Put reviewed evidence ahead of headline discovery.

1. Reviewed company developments appear first with source links and strategic implications.

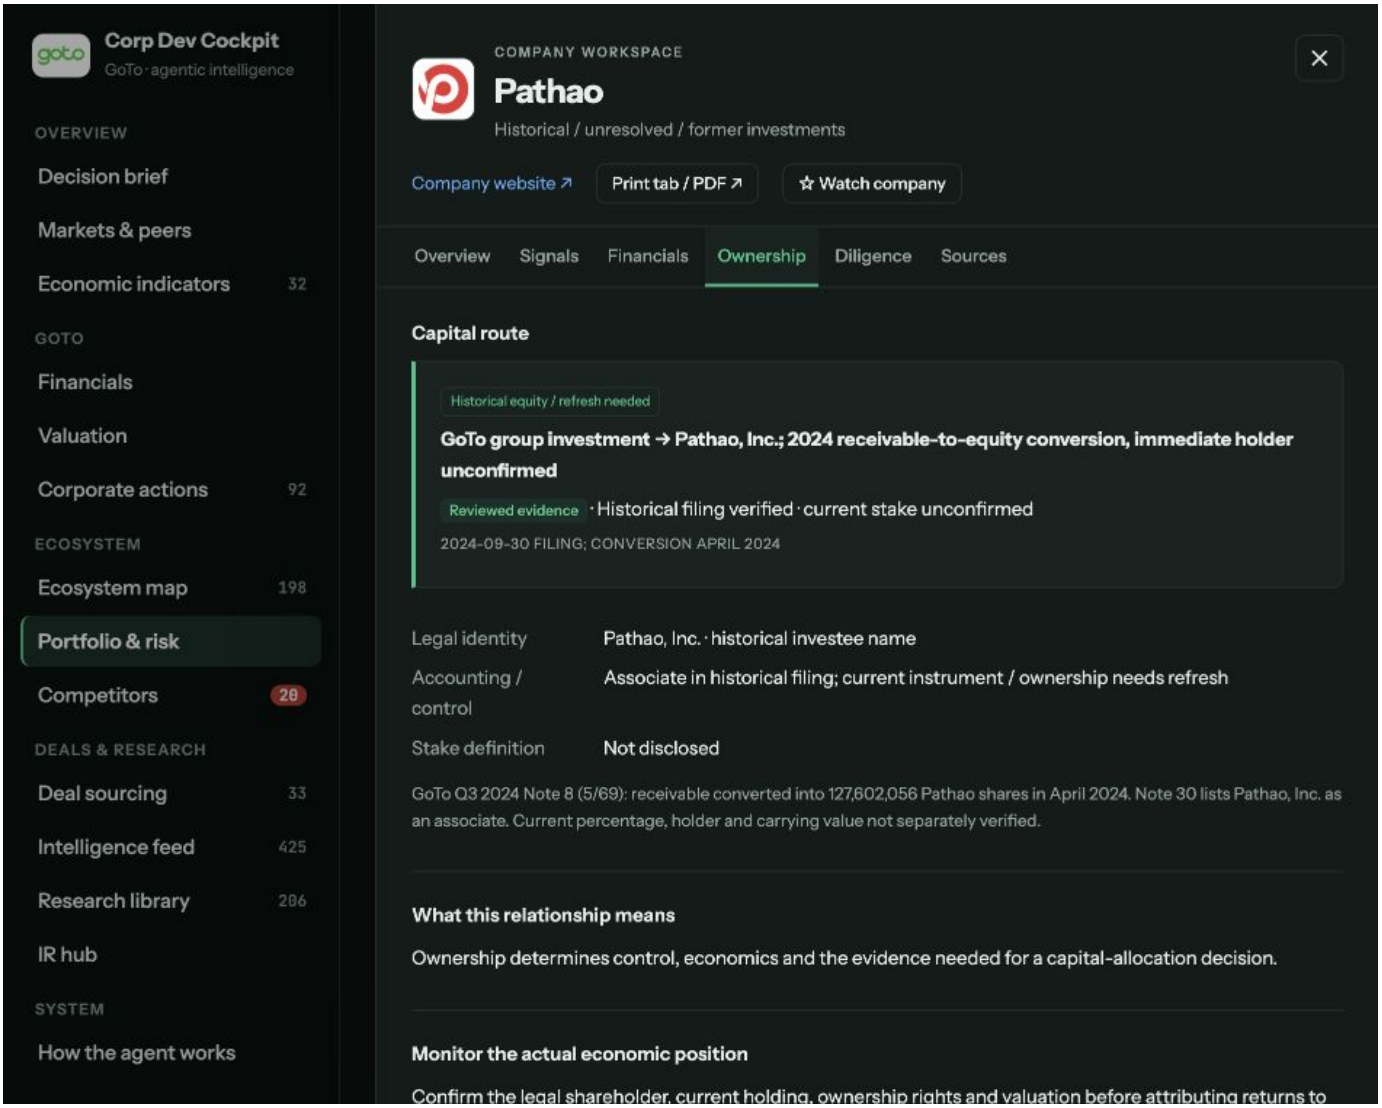

2. Additional RSS matches remain discovery leads and can be expanded for article review.

3. The same workflow applies across company profiles; broader coverage does not imply every company has equally complete public disclosures.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

Company ownership

Inspect the legal relationship before attributing economics.

1. Ownership information shows the position route, percentage basis, evidence date and typed connections where established.

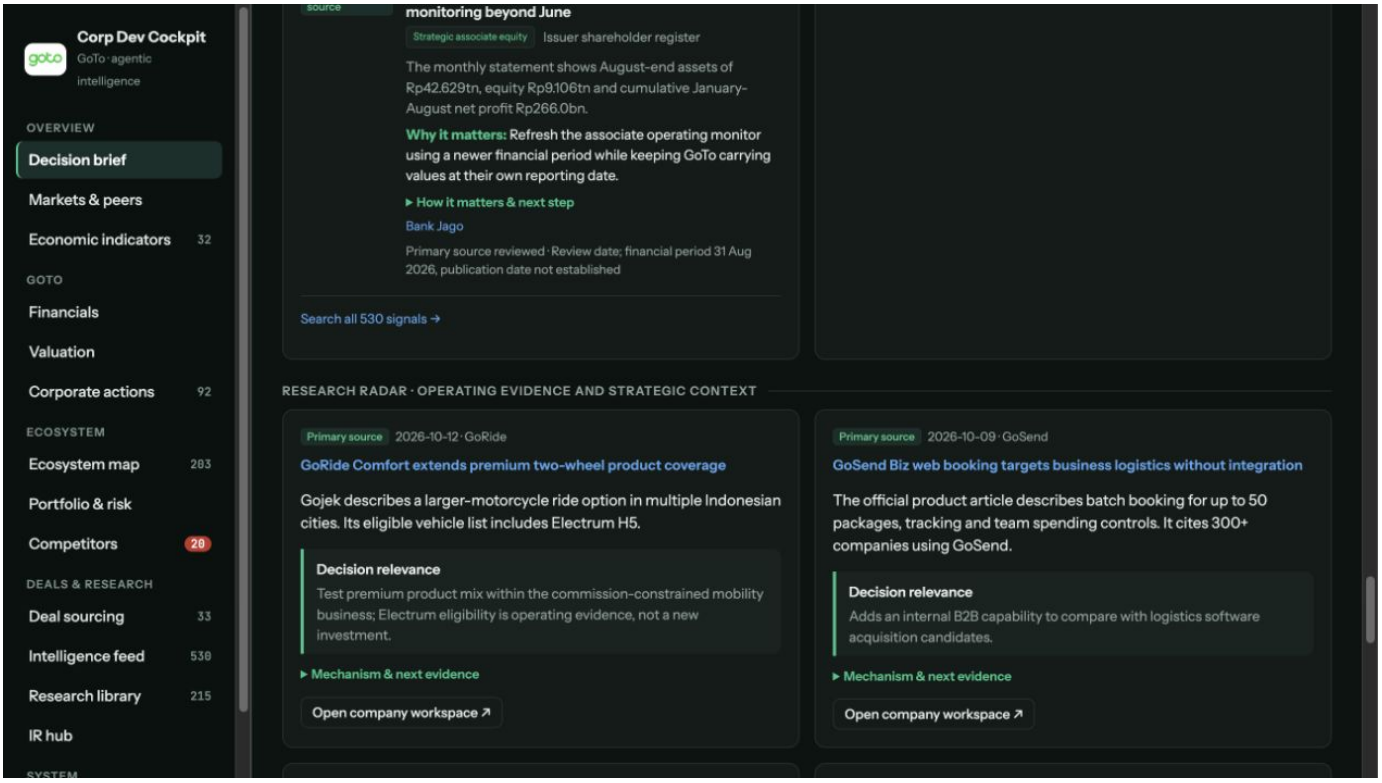

2. Company Financials provides issuer metrics and listed-company or parent TradingView access where mapped. Diligence and Sources complete the workspace.

3. Private current stakes, capitalization tables and GoTo-attributable returns may be undisclosed. Request the missing evidence before computing exposure.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

Research radar

Connect fresh operating evidence with the strategic decision.

1. The decision brief now includes current GoRide Comfort, GoSend Biz, GoStar and Bank Jago evidence alongside dated regional research.

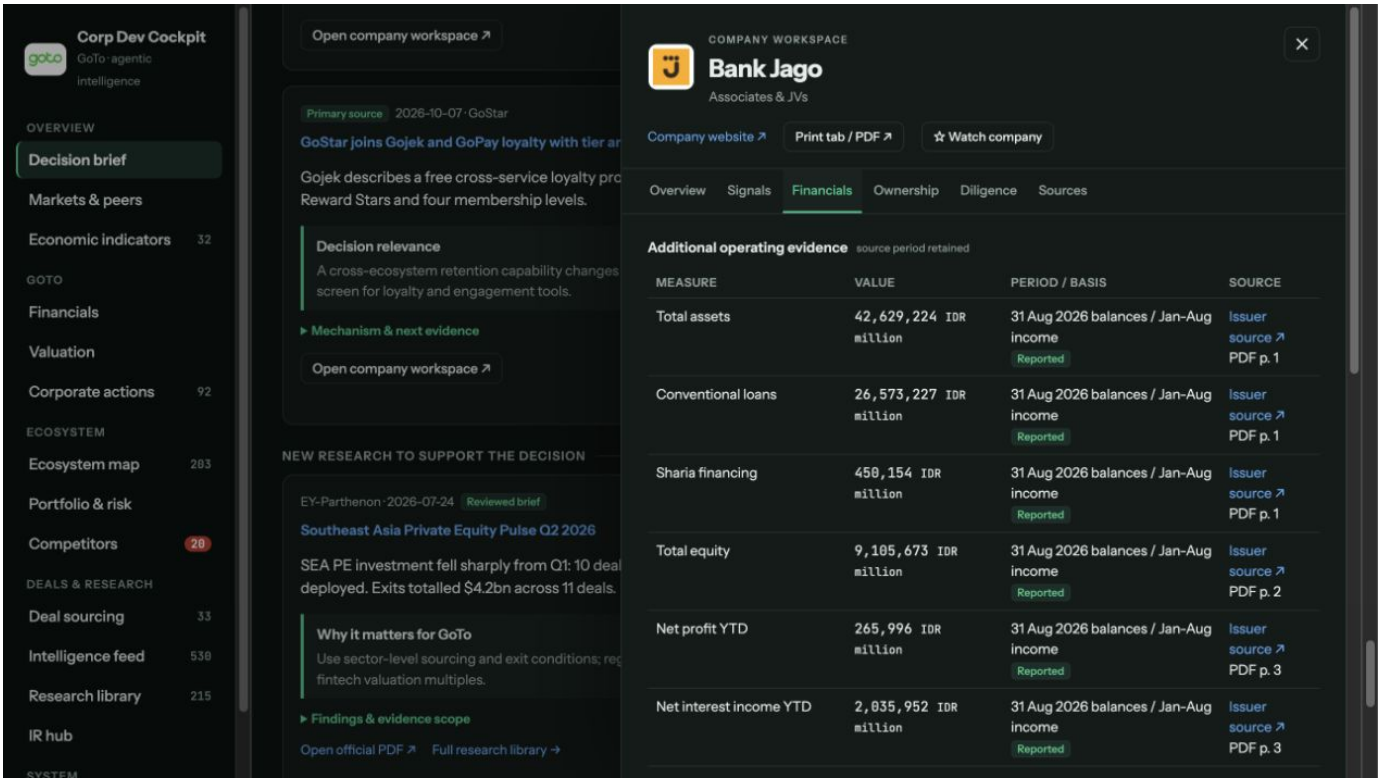

2. Each card provides a source, decision relevance, mechanism and next evidence check. Product news is separate from a verified ownership change.

3. This release adds 19 primary-source signals and nine reviewed research briefs. Broader RSS coverage remains a discovery layer.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

Newer operating evidence

Extend company monitoring while preserving reporting definitions.

1. Company Financials now includes 26 additional issuer operating data points across GoTo, Bank Jago, Uber and DoorDash.

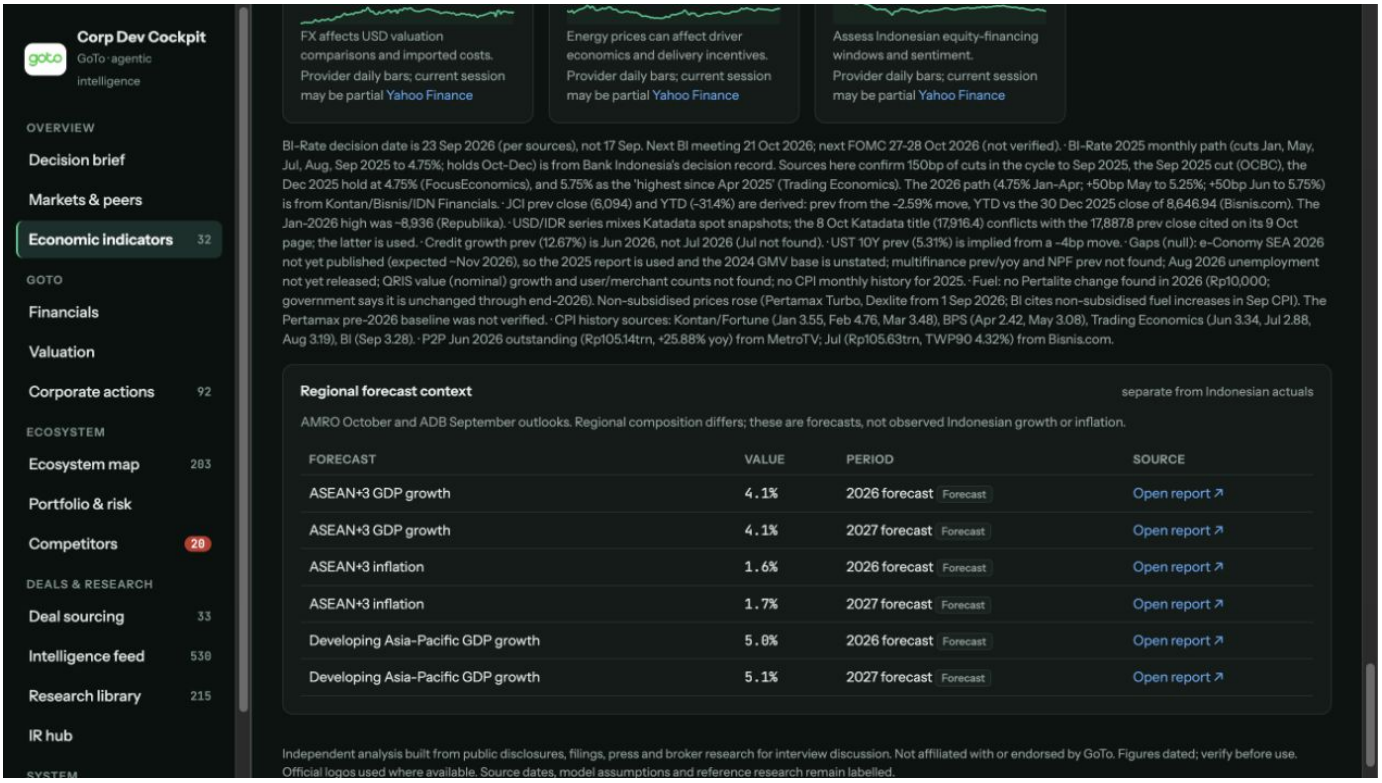

2. Bank Jago August balances and cumulative January-August income remain distinct from the H1 snapshot and GoTo June carrying value.

3. Calculated deposit and lending sums show their components and PDF page references. Global peer figures are not Indonesia market-share estimates.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

Regional forecast context

Use current outlooks without treating forecasts as reported results.

1. Six labelled regional growth and inflation forecasts supplement the economic indicator workspace.

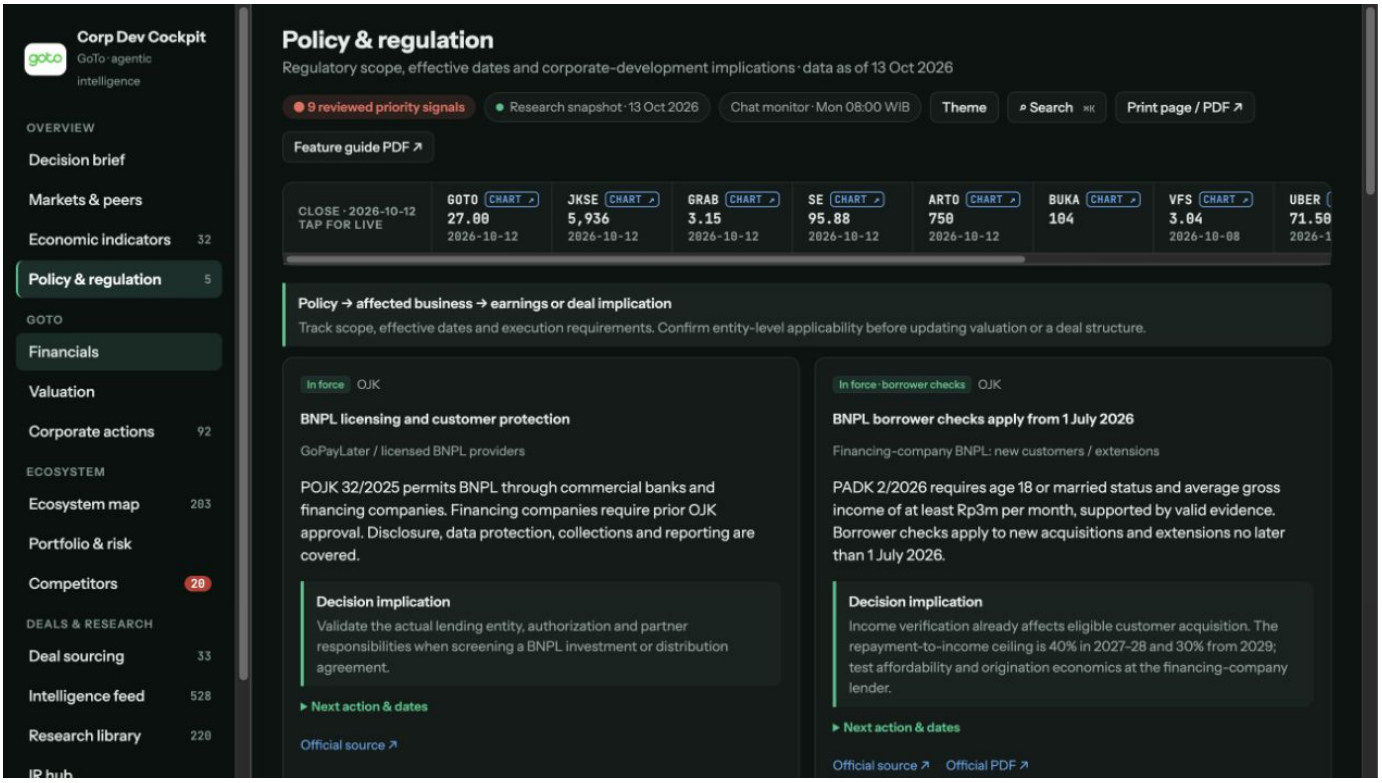

2. AMRO October and ADB September estimates describe different regional populations. Their composition, periods and definitions are retained.

3. Use the linked outlooks for scenario framing, then calibrate GoTo assumptions with Indonesia-specific demand, funding and credit evidence.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

Policy watch

Follow the actual rule, scope and effective date.

1. Five sourced policy topics connect BNPL, payments, merchant fees and M&A; notification to GoTo businesses and deal decisions.

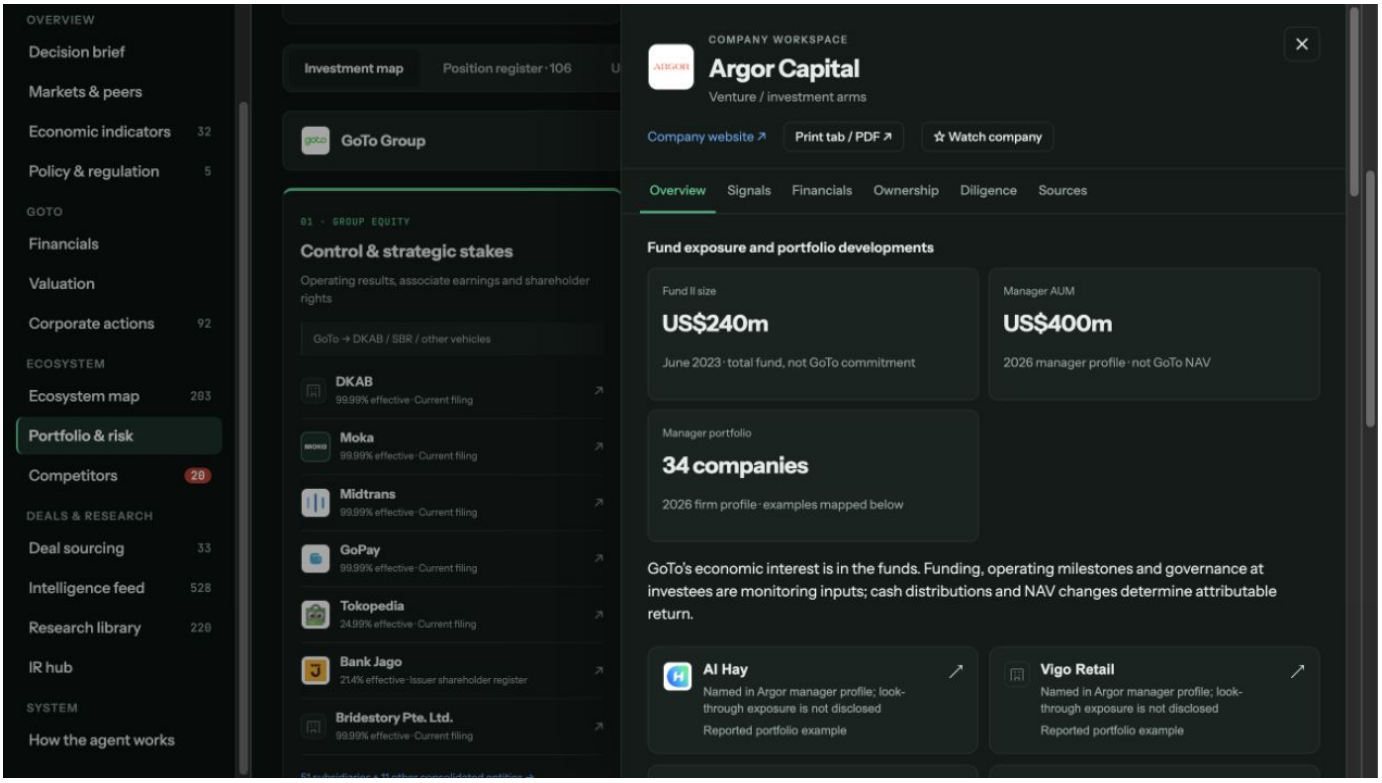

2. OJK PADK 2/2026 sets borrower checks by 1 July 2026, earlier than the older January 2027 announcement. The official FAQ also describes future repayment-to-income limits.

3. Policy records keep the authority, affected entity, dates, implication, next action and official source or PDF together.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

Argor portfolio intelligence

Connect indirect fund exposure with underlying operating developments.

1. The workspace shows Fund II size, manager AUM and company examples with their different scopes and vintages.

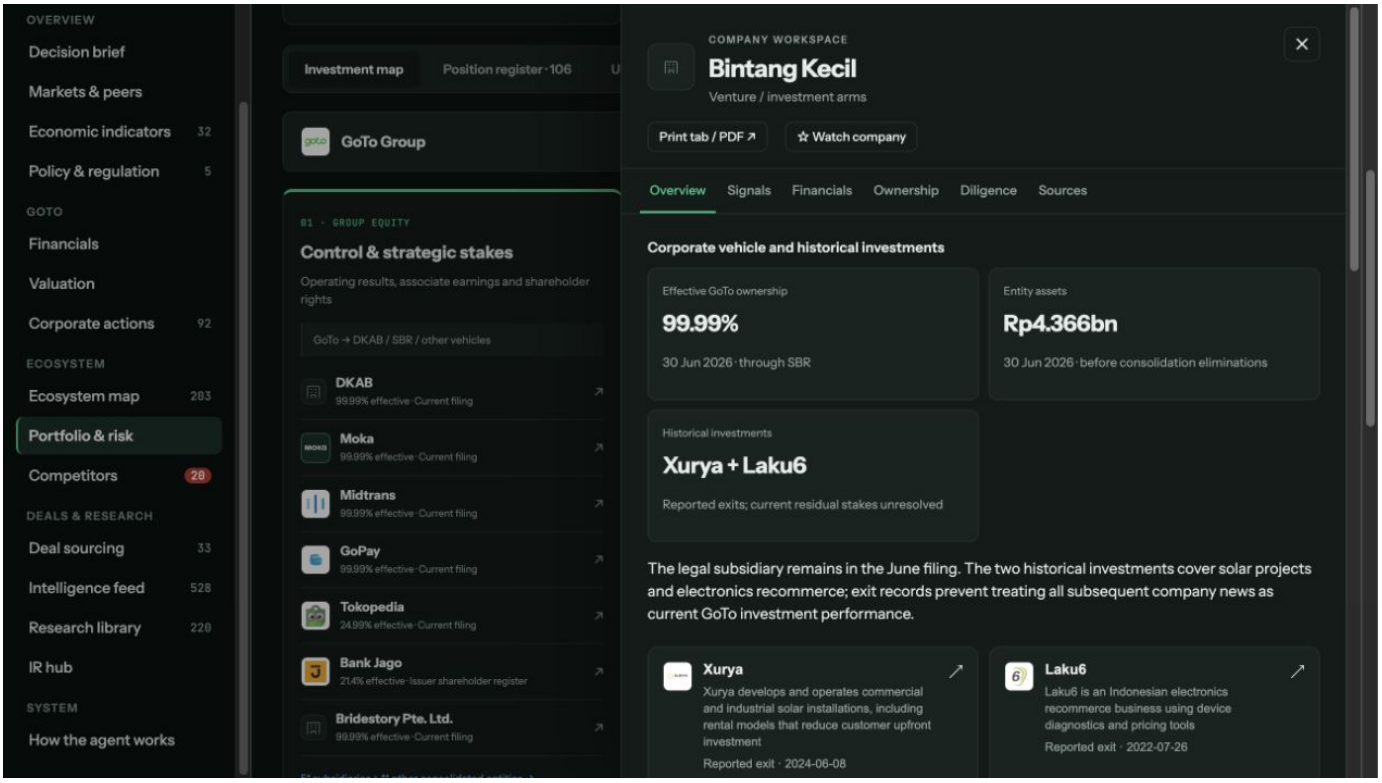

2. Pluang, Halodoc and other portfolio developments support capability, risk and partnership monitoring; reported exits and historical positions are separately labelled.

3. GoTo-attributable NAV, commitments, distributions and returns require actual fund capital accounts. Manager AUM is not GoTo investment value.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

Bintang Kecil investments

Separate the corporate vehicle, historical investments and operating news.

1. The vehicle shows 99.99% effective group ownership and Rp4.366bn assets before eliminations at June 2026.

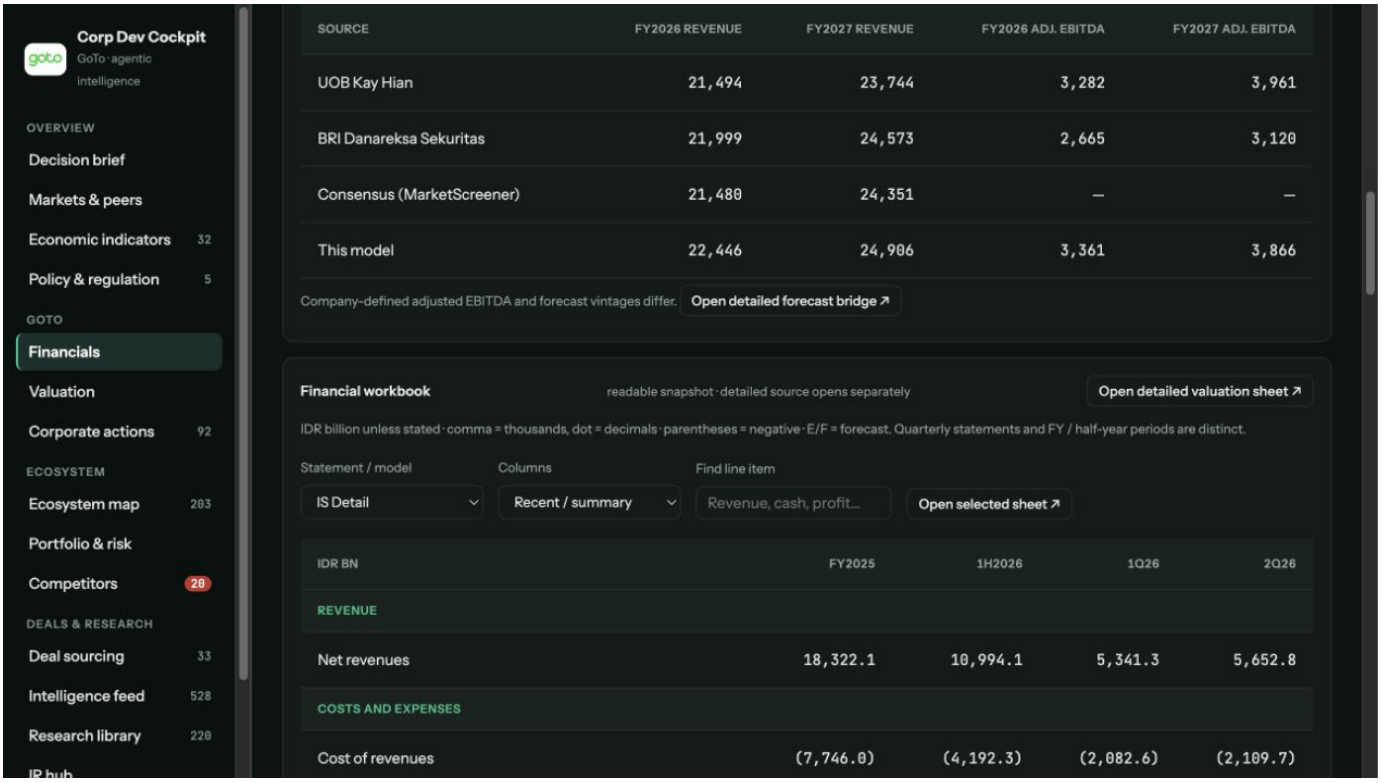

2. Xurya solar energy and Laku6 recommerce have business descriptions, source links and reported exit dates. Current residual holdings remain unconfirmed.

3. Company operating news supports historical-investment and partnership review; it is not automatically current GoTo portfolio performance.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

Readable financial workbook

See recent periods first, then expand or open the source.

1. Income statement, balance sheet and cash-flow views use larger numbers, clear periods and consistent English number formatting.

2. Choose recent or all periods, search a line item, and open the selected original sheet in a separate tab. Blank fields remain unavailable rather than zero.

3. The snapshot retains the complete original workbook. Forecasts, source values and model assumptions stay distinct.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

Readable valuation peers

Compare key multiples without a sixteen-column grid.

1. The summary highlights the workbook median and shows seven peers with price, quote currency and three key valuation multiples.

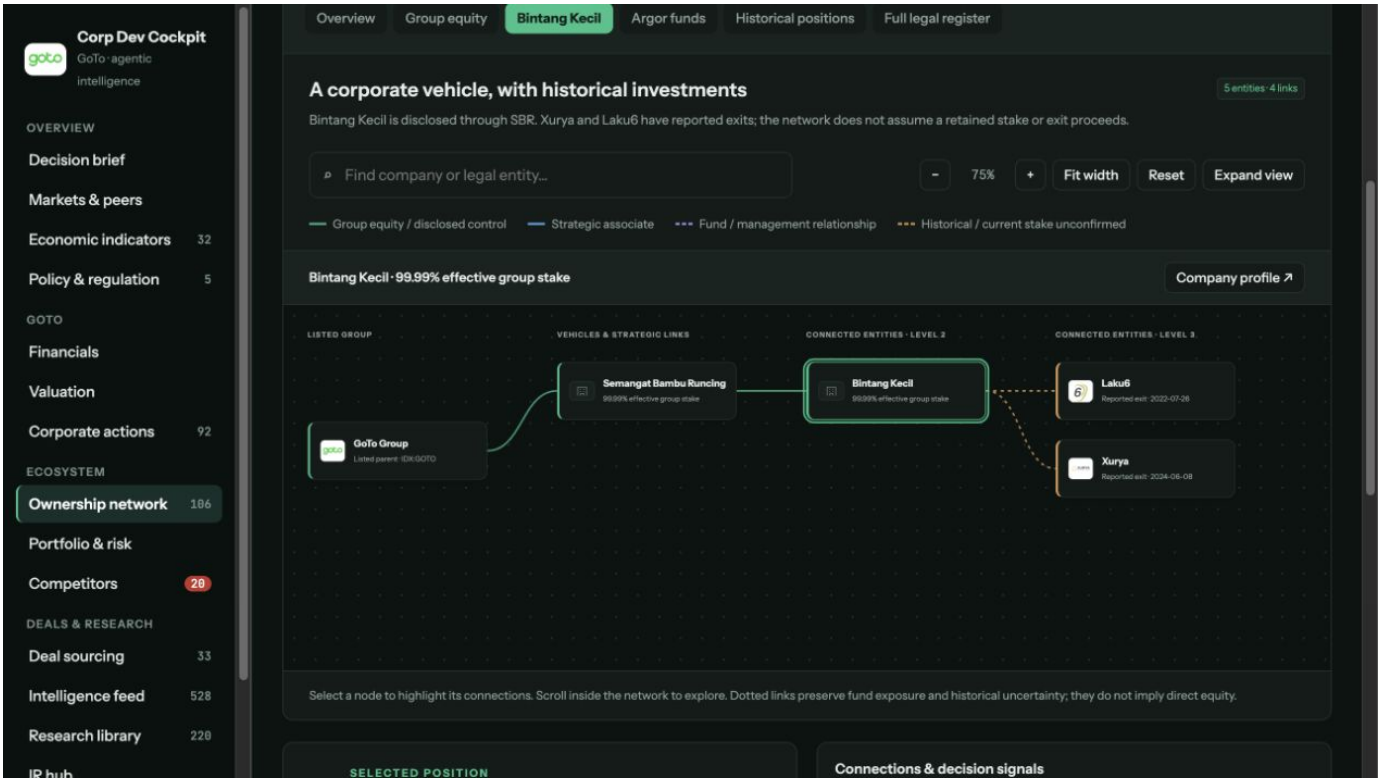

2. Expand a company to inspect capitalization, enterprise value, revenue, EBITDA, net income and beta with explicit financial units.

3. Meituan trading prices are HKD while its financial values are CNY million. Banking and negative enterprise value require different valuation treatment.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

Ownership route diligence

Current group control and historical investments have different meaning.

1. Bintang Kecil is shown through SBR, with Xurya and Laku6 linked as historical investments with reported exits. A reported exit does not establish proceeds or a remaining stake.

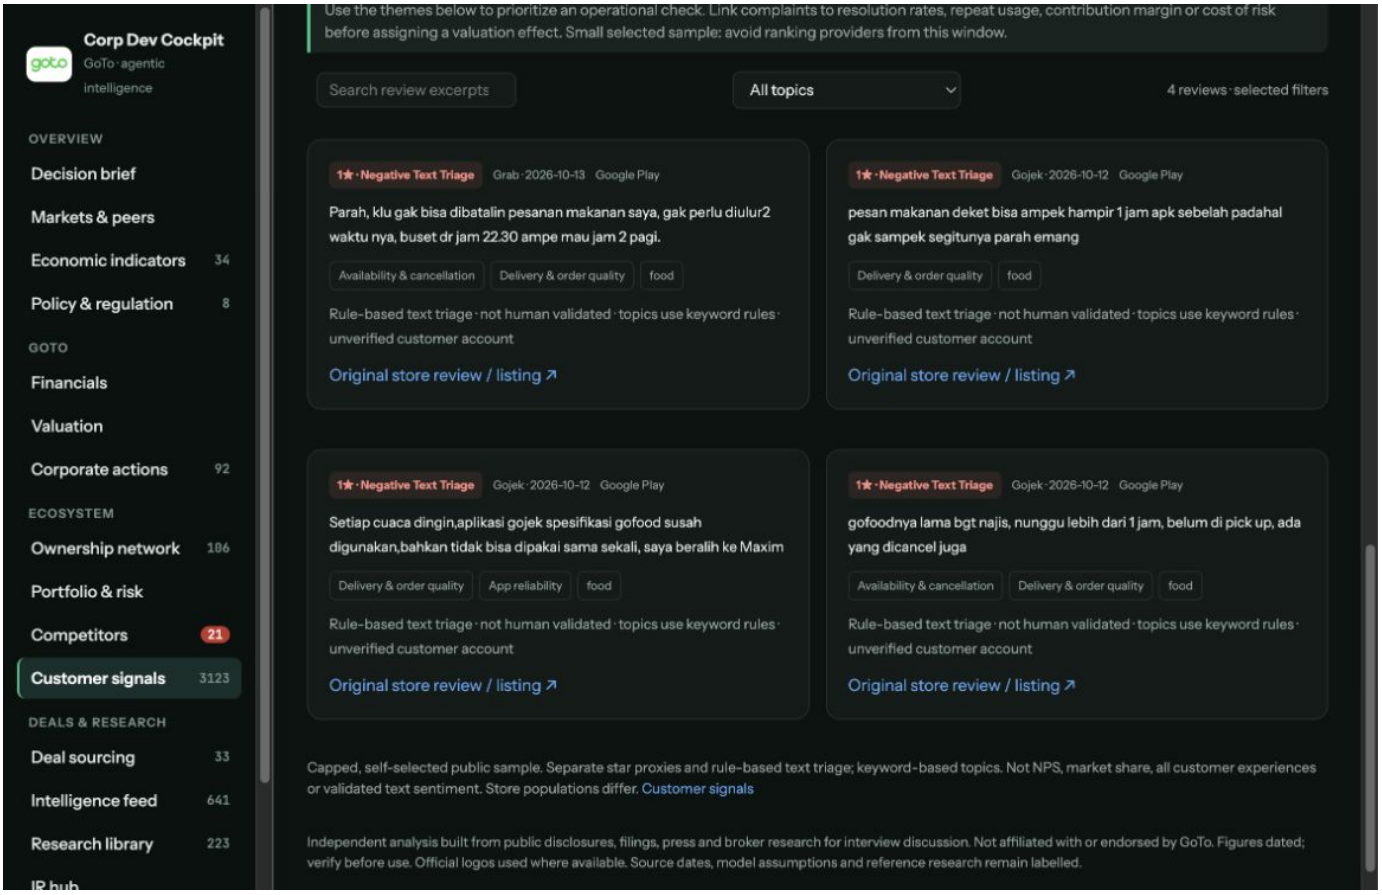

2. Argor is a fund manager. The fund view separates GoTo backing, the managed fund family and reported portfolio examples; it does not invent direct GoTo ownership or attributable NAV.

3. The full legal view includes all 62 disclosed consolidated entities plus the listed parent. Disclosed intermediary groupings and effective group percentages retain their source limitations.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

Aligned service comparison

One selected service and peer, with clear scope and decision factors.

1. Switch between seven ODS and nine financial-service lenses. Select the peer once; the business and customer workspaces preserve that context.

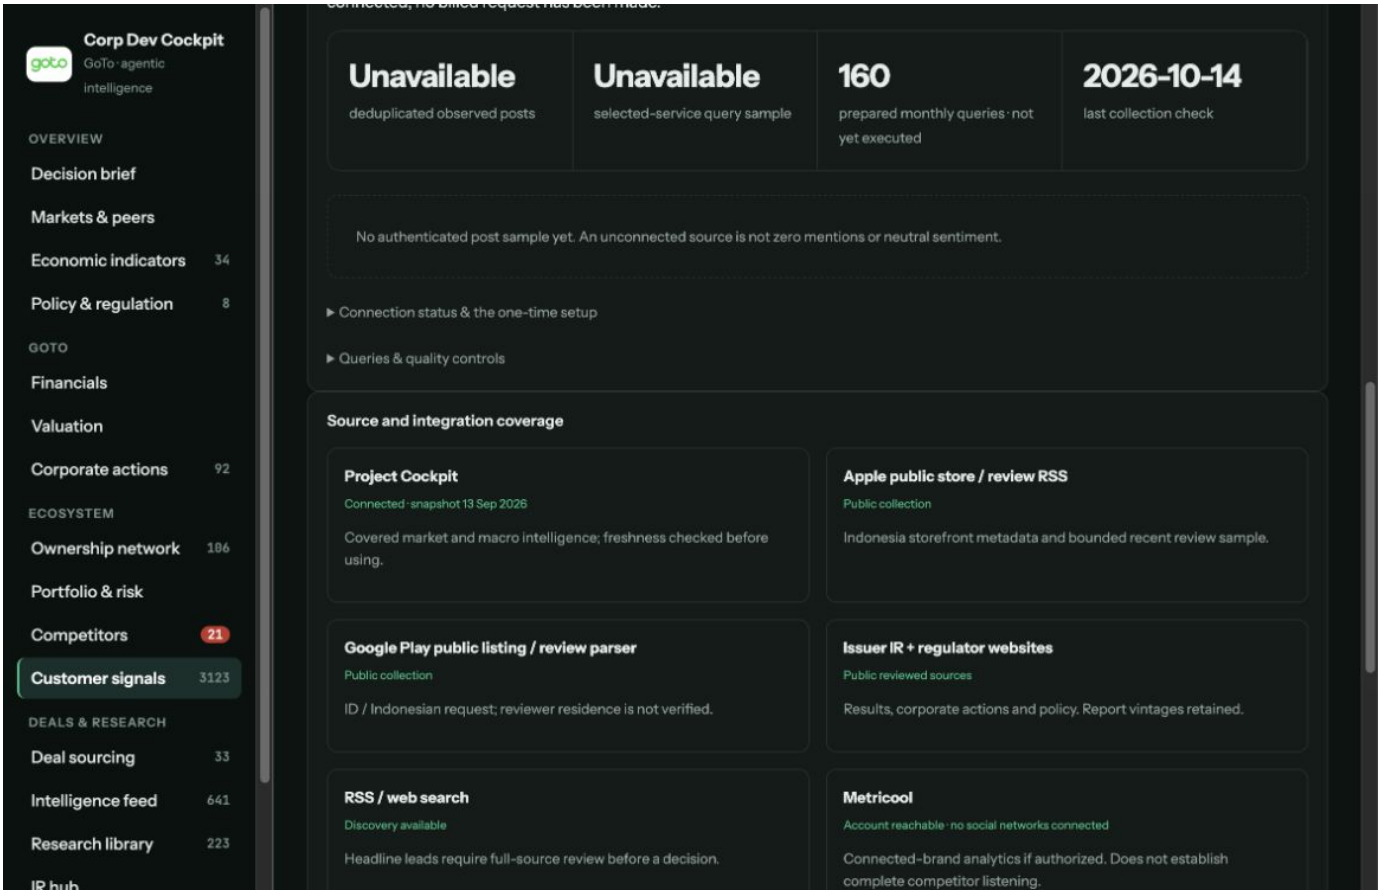

2. The aligned table separates service capability, reporting scope, revenue, adjusted EBITDA and evidence gaps. Different currencies or issuer segments are not ranked as though they were identical.

3. Supportive factors, headwinds and unresolved developments use a GoTo decision lens. Corporate actions retain proposed / completed status and source labels; context expands inside the dashboard.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

Customer signals

Store ratings and observed feedback, directly in the dashboard.

1. The collection checks 52 customer, driver, merchant and business apps across two stores. It contains 99 ratings from 104 checks and refreshed bounded public review observations as of 14 October.

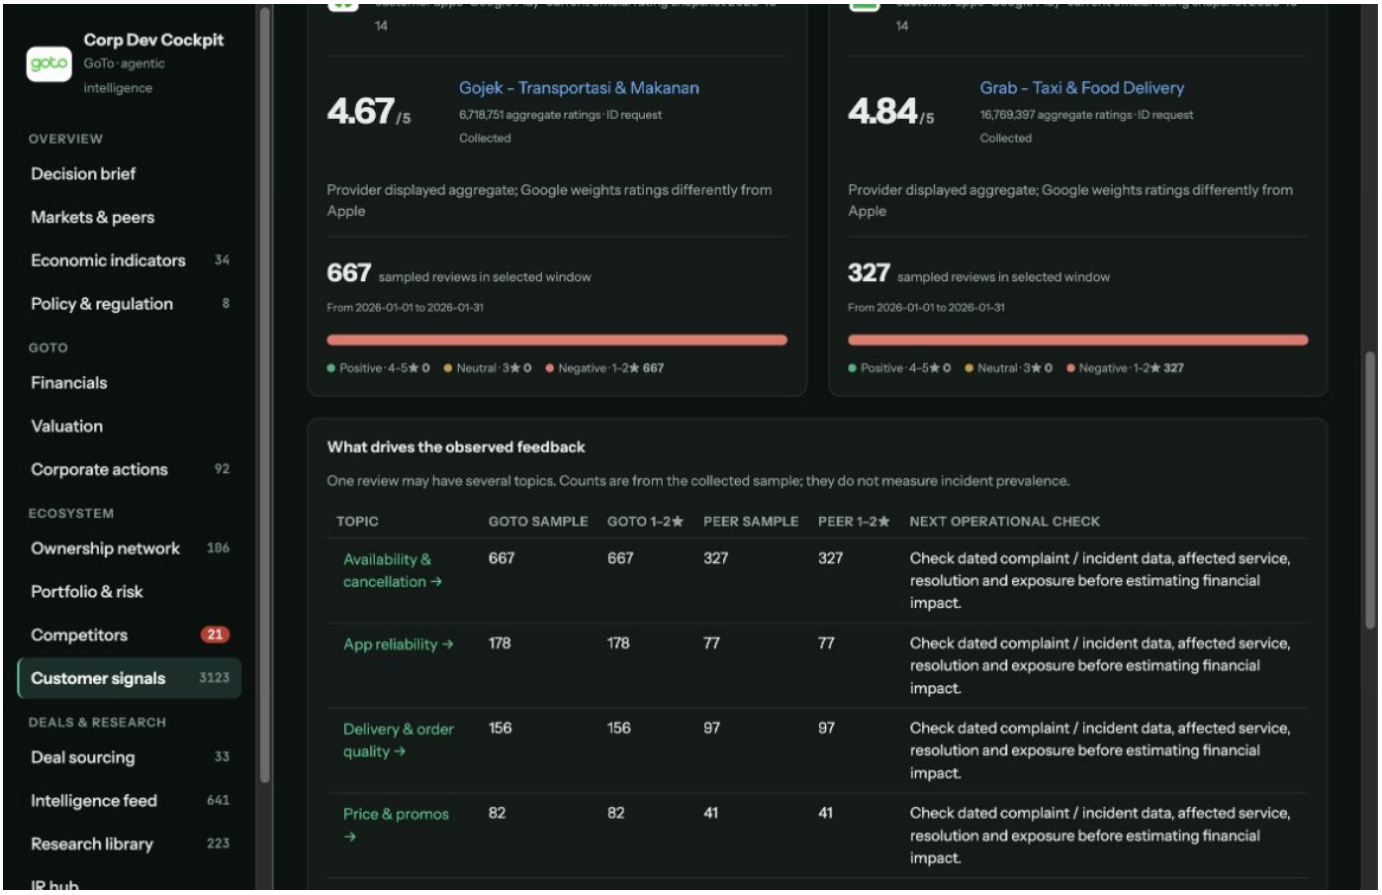

2. Choose the peer, platform, app audience, date window, classification and direction. Explicit service matching is enabled by default; generic multi-service reviews are not automatically GoFood or GoRide complaints.

3. Star-rating direction and bilingual keyword text triage are separate. Mixed and uncertain classifications remain visible. These are self-selected samples, not NPS, complete mentions or market share.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

Review topics and diligence

Connect qualitative feedback to an operational check.

1. Topic drivers compare observed themes and low-star counts across the selected GoTo app and peer. One review can have multiple topics; the table retains that limitation.

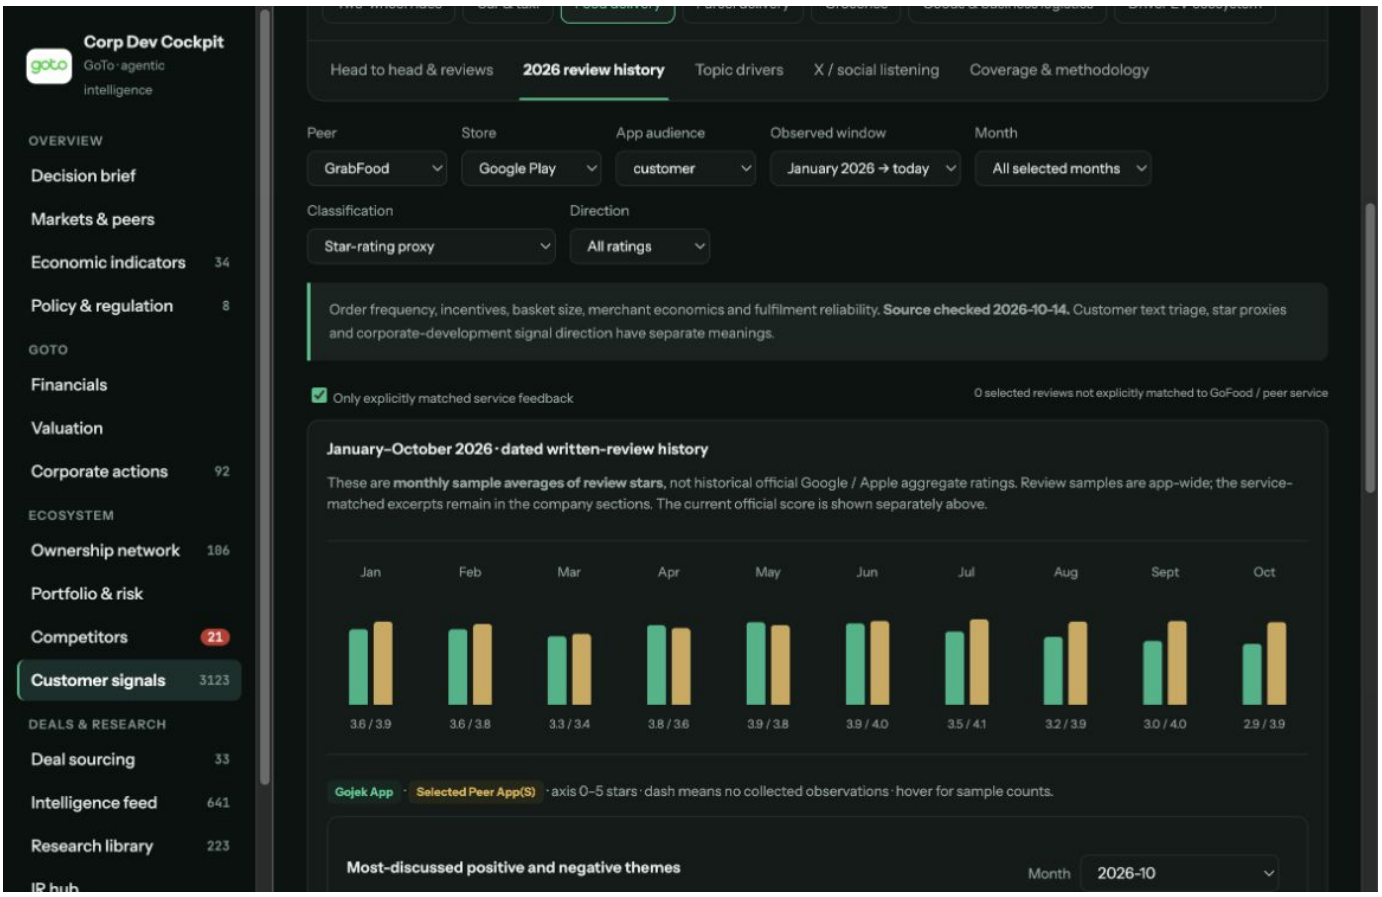

2. Click a topic to read the matching review excerpts in the same dashboard. Topics cover pricing, availability, delivery, payments, fees, collections, refunds, support, onboarding, reliability and alleged safety issues.

3. Validate complaints against incident, resolution and service-level operating data before estimating churn, revenue or valuation effects. No unverified allegation is presented as an established fact.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

Monthly review ratings

Compare monthly sampled review stars with their coverage visible.

1. January–October bars compare the selected GoTo app with the selected peer. These are averages of collected dated written-review stars, with sample counts available inside the page.

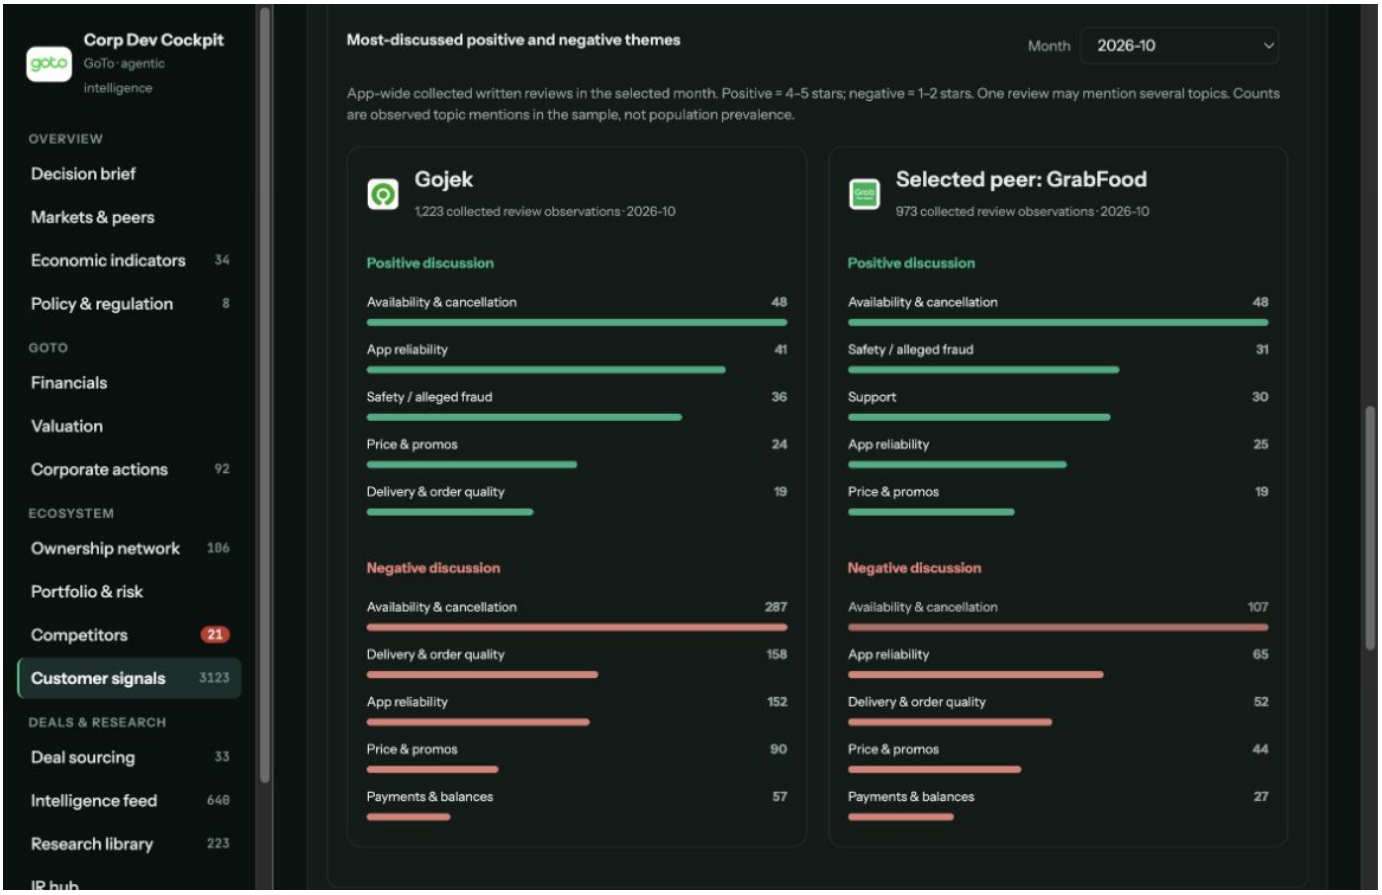

2. Official current store ratings remain a separate dated snapshot. Missing months, Apple RSS limits and provider pagination gaps are not interpolated or represented as zero stars.

3. The complete historical collection contains over 1.36 million dated observations across 99 resolved app-store pairs. Shopee and DANA public history ended after January despite extended pagination; their earlier gaps stay explicit.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

Monthly positive / negative topics

Choose a month and turn a topic into directly readable evidence.

1. Each company has its own topic panel. Positive and negative defaults use 4–5 and 1–2 review stars; bilingual rule-based text triage is an optional, separate classification.

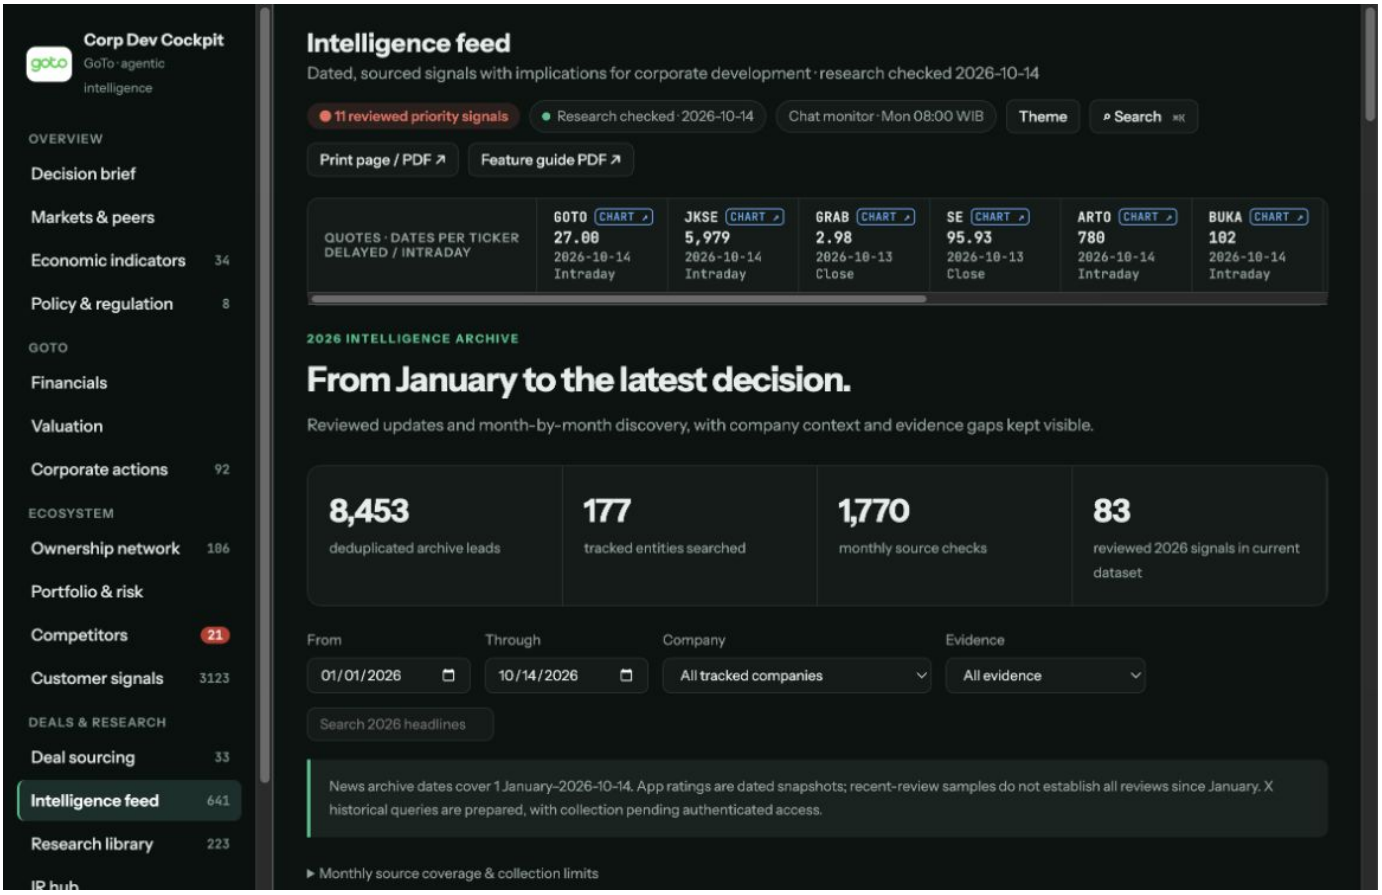

2. Topics count keyword mentions within collected written reviews. A review can mention multiple themes, and a high-star review can contain a complaint. Counts are not population sentiment or causal evidence.

3. Click a theme to filter the month, topic and direction, then read the selected GoTo and peer review sections in the same dashboard. Monthly compressed evidence loads on demand.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

January–October news archive

Search historical signals without mixing discovery with reviewed facts.

1. The archive contains 8,450 deduplicated headline leads from 1,770 monthly source checks covering 177 companies. Reviewed 2026 signals remain a separate evidence tier.

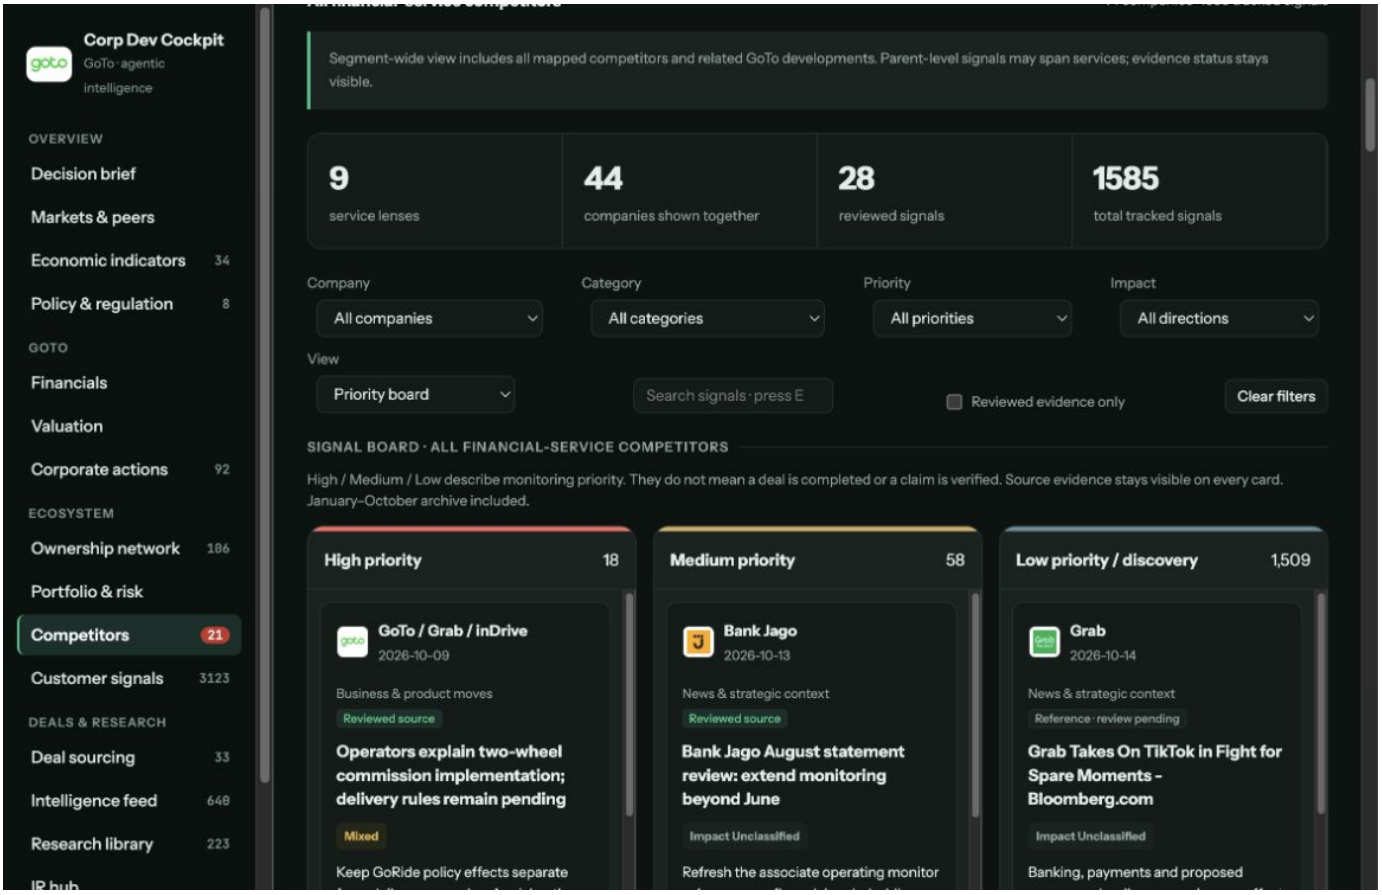

2. Company, evidence, date and text filters retain context inside the dashboard. Source coverage shows the bounded or truncated searches; it is not every article published.

3. Archive text is loaded only in Intelligence feed. Headlines require full-source review before becoming a decision brief or a claimed current investment exposure.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

Priority kanban signal board

All segment signals with a consistent company card and priority.

1. ODS and Financial Services each show their full tracked company universe. High, Medium and Low columns describe analyst monitoring priority, separately from source verification and transaction completion.

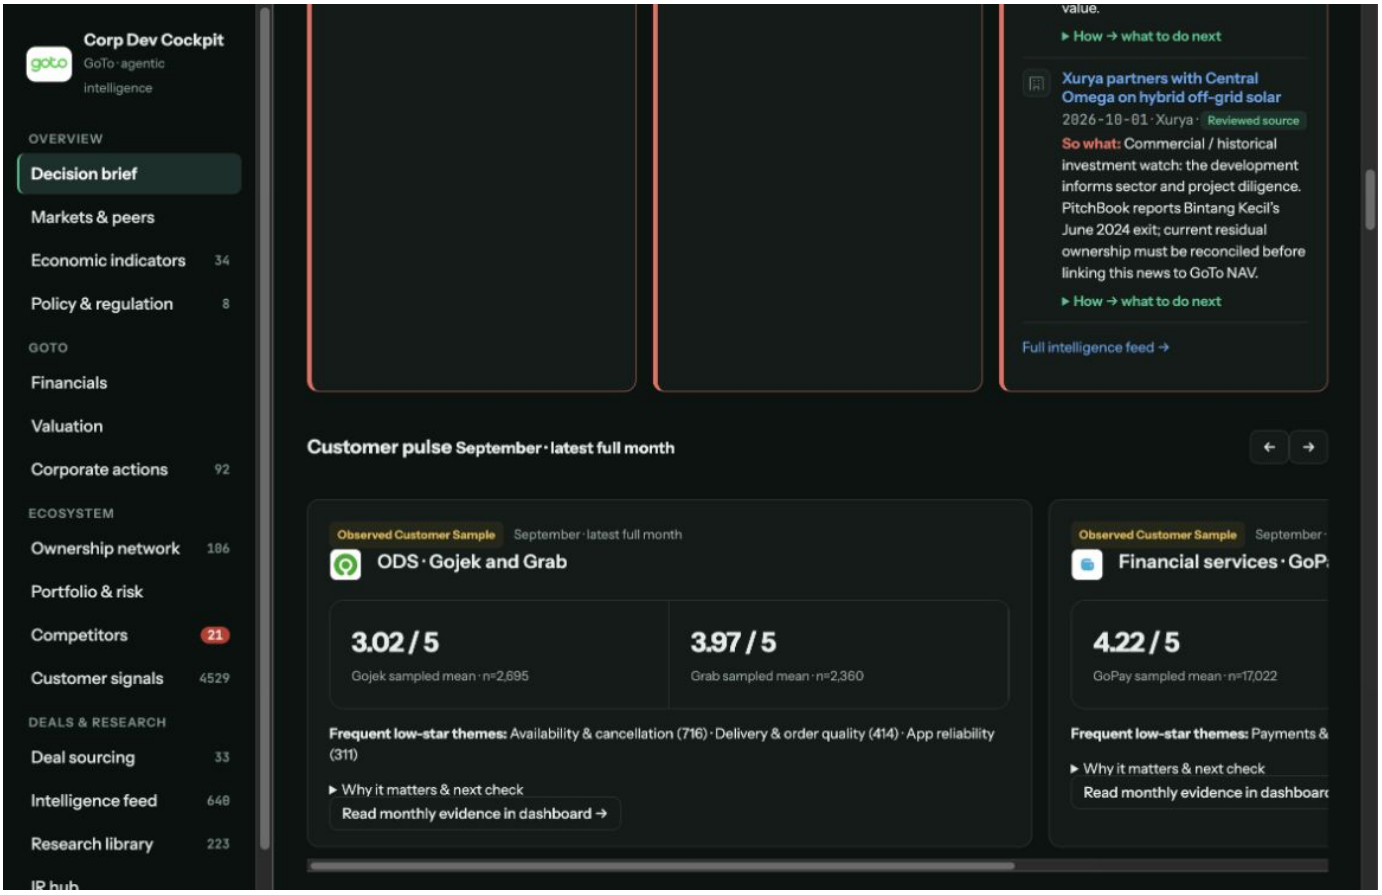

2. Company logos, dates, category labels and evidence status follow the same card format. Expand a card for the full implication, mechanism, next check and in-dashboard company details.

3. Filter company, category, priority, impact and text; keep reviewed evidence only when needed. A category-section view remains available. Annual archive records load in the background; pagination keeps the board responsive.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

Decision brief and reviewed priorities

Combine confirmed developments, observed customer signals and source gaps.

1. The brief links both competitor segment boards and surfaces September monthly customer samples for Gojek versus Grab and GoPay versus DANA. Full-month review means and low-star themes stay separate from official ratings and financial facts.

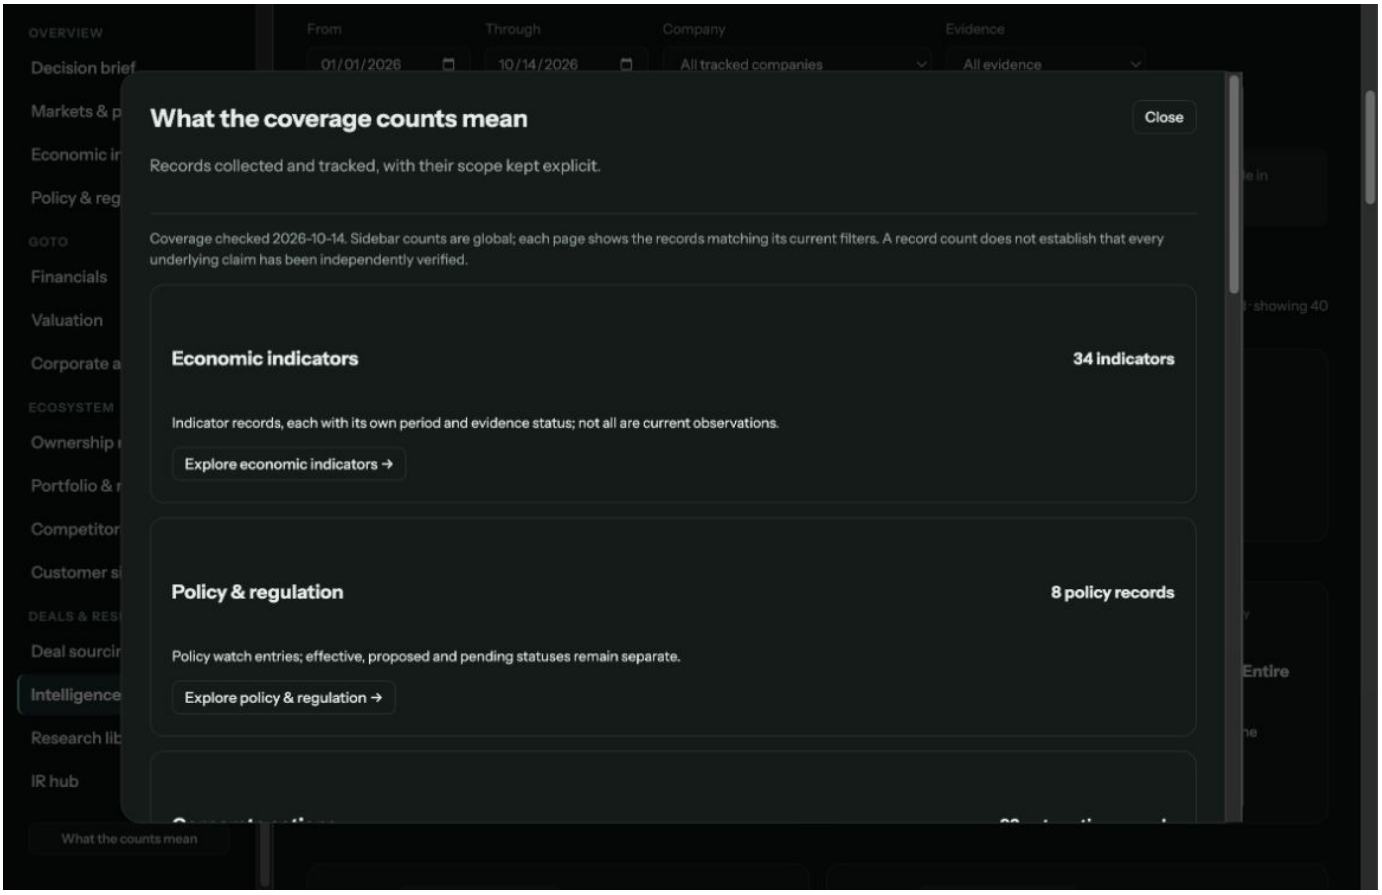

2. Customer friction becomes a diligence hypothesis with a next operational check, while coverage cards expose the news archive, review history, unresolved store identities and missing historical store observations.

3. The reviewed-priority badge now opens the complete reviewed high-priority signal list directly in a dialog. Each signal has company identity, scope, evidence, implication and next check.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.

Coverage counts reconciled

Know exactly what each sidebar badge measures.

1. Tracked peers and benchmarks: 63 unique IDs. The segment views contain 21 ODS and 44 financial-services entries, with Grab and Sea shared between them. The old red badge mixed risk entities and action records.

2. Dated written reviews: 1,370,230, unique within an app/store. The separate 4,529 recent samples overlap the historical view and are not added again. Store history remains source-limited; these are not unique customers or historical official scores.

3. The 2026 feed reconciles 638 curated records and 8,450 archive articles, excluding 352 overlapping source URLs. The 219 research entries include 32 reviewed summaries.

4. The What the counts mean button explains the global populations. Page filters show their own matching totals. Indicators, policy records, positions, corporate actions and screened names each have different units and evidence scope.

Actual released dashboard screenshot. Counts can change with research refreshes; source dates and evidence scope apply.
